Polycyclic Aromatic Hydrocarbons And Astrophysics:

Polycyclic Aromatic Hydrocarbons and Astrophysics A. Léger, L. D'Hendecourt, N. Boccara, 2012-12-06 The near Infra Red emission of the Interstellar Medium is a very puzzling subject In the brightest regions where spectroscopic observations are possible from the ground several bands 3 3 3 4 6 2 7 7 8 6 11 3 μm have been observed since 1973 The absence of satisfying explanation was so obvious that they were called Unidentified IR Emission Bands The puzzle still increased when were known the first results of the general IR sky survey made by the satellite IRAS On a large scale the near IR emission of the Interstellar medium was expected to be very small but it was observed to be about one third of the total IR emission for our own galaxy The situation has moved in 1984 when it was suggested that a class of stable organic molecules the Polycyclic Aromatic Hydrocarbons PAHs could be at the origin of this near IR emission Initially based on the required refractory character of particules that should be heated to high temperature without subliming this hypothesis leads to a suggestive spectroscopic similarity with the observed astronomical bands This hypothesis is attractive and it has many implications for instance the PAHs would be the most abundant organic molecules in the universe However many points have to be clarified and the different consequences of this suggestion should be explored Electronic and nuclear quantum dynamics of molecules in intense laser fields Yuichi Fujimura, Andre Bandrauk, Leticia González, 2023-04-28 *Literature 1987, Part 1* S. Bleeker, Johannes Geiss, M. Huber, 2012-12-06 One of the most attractive features of the young discipline of Space

Science is that many of the original pioneers and key players involved are still available to describe their field. Hence at this point in history we are in a unique position to gain first hand insight into the field and its development. To this end *The Century of Space Science* a scholarly authoritative reference book presents a chapter by chapter retrospective of space science as studied in the 20th century. The level is academic and focuses on key discoveries, how these were arrived at, their scientific consequences and how these discoveries advanced the thoughts of the key players involved. With over 90 world class contributors such as James Van Allen, Cornelis de Jager, Eugene Parker, Reimar Lüst and Ernst Stuhlinger and with a Foreword by Lodewijk Woltjer, past ESO Director General, this book will be immensely useful to readers in the fields of space science, astronomy and the history of science. Both academic institutions and researchers will find that this major reference work makes an invaluable addition to their collection.

The book presents contributions from chemists, physicists and astronomers emphasising the interdisciplinary nature of space research. Material processing in space and simulation in the laboratory are examined here as well as the properties of grains, comets, meteorites, planets and satellites in connection with past and future space missions. The effects of irradiation by UV and ions are presented in detail. **Memorie della Società astronomica italiana** Società astronomica italiana, 1990 **Mitteilungen der Astronomischen Gesellschaft** Astronomische Gesellschaft (Germany), 2008 *Polycyclic Aromatic Hydrocarbons and*

Driven by ground based, airborne and IRAS observations, the PAH hypothesis was first formulated in the mid eighties: the widespread emission features in the 3-13 μ m range are due to UV pumped IR fluorescence by large Polycyclic Aromatic Hydrocarbon molecules. These molecules are a ubiquitous component of the interstellar medium both in local galaxies as well as out to redshifts of 3 and probably beyond. They play an important role in its physical and chemical characteristics and form a key link between small hydrocarbon species and large carbonaceous grains. This book gathers contributions that reflect the evolution of the field over the last 25 years, taking advantage of IR space missions ISO, Spitzer and AKARI and of dedicated experimental and quantum chemical studies. We have now reached a stage where we can develop these mid infrared features as diagnostic tools to study star formation processes, protoplanetary disks as well as galaxy assemblage in the early Universe. The current Herschel/Planck era opens the possibility to better characterize the

mid IR carriers through their contribution to the far IR and mm emissions Still much effort is required before we will fully understand the formation and nature of interstellar PAHs and their role in the Universe Physical chemists can play an important role in driving this field This book aims at discussing the state of the art of the PAH hypothesis and to chart the future in this interdisciplinary field It highlights the various aspects of interstellar PAHs Rich IR spectra of interstellar PAHs PAHs and star formation in the near and far Universe The lifecycle of PAHs in space PAHs in regions of planet formation PAHs and carbonaceous grains Solar system materials Space Life Sciences D.
