Polymers in Microlithography ,1989 **Processes in Photoreactive Polymers** V.V. Krongauz,A.D.

Trifunac,1995-02-28 The development of photosensitive materials in general and photoreactive polymers in particular is responsible for major advances in the information imaging and electronic industries Computer parts manufacturing information storage and book and magazine publishing all depend on photoreactive polymer systems The photo and radiation induced processes in polymers are also active areas of research New information on the preparation and properties of commercially available photosensitive systems is constantly being acquired The recent demand for environmentally safe solvent free and water soluble materials also motivated changes in the composition of photopolymers and photoresists The interest in holographic recording media for head up displays light scanners and data recording stimulated development of reconfigurable and visible light sensitive materials Photoconductive polymerizable coatings are being tested in electrostatic proofing and color printing The list of available initiators polymeric binders and other coating ingredients is continually evolving to respond to the requirements of low component loss low diffusivity and the high rate of photochemical reactions

Radiation Curing in Polymer Science and Technology Jean-Pierre Fouassier,Jan F. RABEK,1993-07-31 Volume Four discusses the applications of radiation curing and provides a synopsis of the latest research in coatings graphic arts microelectronics optical fibres adhesives 3D machining membranes and holographic optical elements as well as considering the worldwide trends in the market **Polymer Science: A Comprehensive Reference** ,2012-12-05 The progress in polymer science is revealed in the chapters of Polymer Science A Comprehensive Reference Ten Volume Set In Volume 1 this is reflected in the improved understanding of the properties of polymers in solution in bulk and in confined situations such as in thin films Volume 2 addresses new characterization techniques such as high resolution optical microscopy scanning probe microscopy and other procedures for surface and interface characterization Volume 3 presents the great progress achieved in precise synthetic polymerization techniques for vinyl monomers to control macromolecular architecture the development of metallocene and post metallocene catalysis for olefin polymerization new ionic polymerization procedures and atom transfer radical polymerization nitroxide mediated polymerization and reversible addition fragmentation chain transfer systems as the most often used controlled living radical polymerization methods Volume 4 is devoted to kinetics mechanisms and applications of ring opening polymerization of heterocyclic monomers and cycloolefins ROMP as well as to various less common polymerization techniques Polycondensation and non chain polymerizations including dendrimer synthesis and various click procedures are covered in Volume 5 Volume 6 focuses on several aspects of controlled macromolecular architectures and soft nano objects including hybrids and bioconjugates Many of the achievements would have not been possible without new characterization techniques like AFM that allowed direct imaging of single molecules and nano objects with a precision available only recently An entirely new aspect in polymer science is based on the combination of bottom up

methods such as polymer synthesis and molecularly programmed self assembly with top down structuring such as lithography and surface templating as presented in Volume 7 It encompasses polymer and nanoparticle assembly in bulk and under confined conditions or influenced by an external field including thin films inorganic organic hybrids or nanofibers Volume 8 expands these concepts focusing on applications in advanced technologies e g in electronic industry and centers on combination with top down approach and functional properties like conductivity Another type of functionality that is of rapidly increasing importance in polymer science is introduced in volume 9 It deals with various aspects of polymers in biology and medicine including the response of living cells and tissue to the contact with biofunctional particles and surfaces The last volume is devoted to the scope and potential provided by environmentally benign and green polymers as well as energy related polymers They discuss new technologies needed for a sustainable economy in our world of limited resources Provides broad and in depth coverage of all aspects of polymer science from synthesis polymerization properties and characterization methods and techniques to nanostructures sustainability and energy and biomedical uses of polymers Provides a definitive source for those entering or researching in this area by integrating the multidisciplinary aspects of the science into one unique up to date reference work Electronic version has complete cross referencing and multi media components Volume editors are world experts in their field including a Nobel Prize winner
