Therapeutic Proteins C. Mark Smales, David C. James, 2008-02-04 With the recent completion of the sequencing of the human genome it is widely anticipated that the number of potential new protein drugs and targets will escalate at an even greater rate than that observed in recent years However identification of a potential target is only part of the process in developing these new next generation protein based drugs that are increasingly being used to treat human disease Once a potential protein drug has been identified the next rate limiting step on the road to development is the production of sufficient authentic material for testing characterization clinical trials and so on If a protein drug does actually make it through this lengthy and costly process methodology that allows the production of the protein on a scale large enough to meet demand must be implemented Furthermore large scale production must not compromise the authenticity of the final product It is also necessary to have robust methods for the purification characterization viral inactivation and continued testing of the authenticity of the final protein product and to be able to formulate it in a manner that retains both its biological activity and lends itself to easy administration *Therapeutic Proteins Methods and Protocols* covers all aspects of protein drug production downstream of the discovery stage This volume contains contributions from leaders in the field of therapeutic protein expression purification characterization formulation and viral inactivation *Access Delayed* United States. *Killer Cell Dynamics* Dominik Wodarz, 2007-04-05 Systems biology and computational biology have recently become prominent areas of research in the biomedical community especially in the area of cell biology Given that much information on genes and their protein products has become available the big question is how the individual components interact and work together and how this determines the functioning of cells organs and organisms Long before the popularity of systems biology in biomedicine however such approaches have been used successfully in a different area of biology population ecology Research in the area of population dynamics investigated complex interactions between different populations of organisms such as the dynamics of competition and predation food webs community structure as well as the epidemiology of infectious diseases In this field theoretical biology and mathematical modeling have become an integral part of

research Mathematical models allowed people to obtain interesting and counter intuitive insights into how complex interactions among different populations can play out Such mathematical studies not only gave rise to interesting theoretical ideas but also provided the basis for the design of new experimental work and defined major questions and directions of research Around 1990 such population dynamic concepts and the use of mathematical computational approaches started to be applied to the in vivo dynamics between viruses and the immune system These interactions have many similarities to ecological epidemiological and evolutionary principles Consider the epidemiological spread of a pathogen such as the common cold through a population of hosts
