Scientific Progress A Study Concerning The Nature Of The Relation Between Successive Scientific Theories:

Scientific Progress Craig Dilworth, 2014-04-21 For the philosopher interested in the idea of objective knowledge of the real world the nature of science is of special importance for science and more particularly physics is today considered to be paradigmatic in its affording of such knowledge And no understanding of science is complete until it includes an appreciation of the nature of the relation between successive scientific theories that is until it includes a conception of scientific progress Now it might be suggested by some that there are a variety of ways in which science progresses or that there are a number of different notions of scientific progress not all of which concern the relation between successive scientific theories For example it may be thought that science progresses through the application of scientific method to areas where it has not previously been applied or through the development of individual theories However it is here suggested that the application of the methods of science to new areas does not concern forward progress so much as lateral expansion and that the provision of a conception of how individual theories develop would lack the generality expected of an account concerning the progress of science itself

Scientific Progress Craig Dilworth, 1986 Featuring the Gestalt Model and the Perspectivist conception of science this book is unique in its non relativistic development of the idea that successive scientific theories are logically incommensurable This edition includes four new appendices in which the central ideas of the book are applied to subatomic physics the distinction between laws and theories the relation between absolute and relative conceptions of space and the environmental issue of sustainable development

Pragmatic Tendencies in Scientific Theory Herbert Stachowiak, 1995 Contemporary Perspectives in Philosophy and Methodology of Science Wenceslao J. González, 2006 Nowadays philosophy and methodology of science appear as a combination of novelty and continuity. This blend is clear both in the general approaches to science, those thought of as any science, and in the specific perspectives on every science, either formal or empirical. There are new topics for philosophical reflection, such as key issues in philosophy of medicine and central problems raised by neuroscience. Thus, new contents have brought attention to aspects that previously went almost unnoticed. In addition, there are new angles for philosophical study, such as the repercussion of society on scientific activity, in aims, processes and results. But the background of the main philosophical and methodological trends of the twentieth century is in many ways still in place.
