Simulation Model Marc-André Parisien, Northern Forestry Centre (Canada), 2005 Resource management in fire dominated  
 ecosystems requires an understanding of the probability of wildfire occurring spreading at different points in a landscape  
 This report describes an approach to evaluating wildfire susceptibility or burn probability for fire prone landscapes such as  
 the boreal forest of North America The approach involves use of the BURN P3 probability prediction planning landscape level  
 simulation model which combines deterministic fire growth based on the Canadian Fire Behaviour Prediction System and  
 spatial data for forest fuels topography with probabilistic fire ignitions spread events derived from historical fire weather  
 data A case study of the application of BURN P3 is undertaken for a boreal mixedwood area of central Saskatchewan The  
 results presented highlight the importance of landscape features to wildfire susceptibility and indicate whether assessments  
 based solely on stand level characteristics are adequate      **Operations Management for Competitive Advantage**
