

THE PREDICTION OF VIOLENCE IN ADULT OFFENDERS

A Meta-Analytic Comparison of Instruments and Methods of Assessment

MARY ANN CAMPBELL
SHEILA FRENCH
PAUL GENDREAU

University of New Brunswick–Saint John, Canada

Using 88 studies from 1980 to 2006, a meta-analysis compares risk instruments and other psychological measures on their ability to predict general (primarily nonsexual) violence in adults. Little variation was found amongst the mean effect sizes of common actuarial or structured risk instruments (i.e., Historical, Clinical, and Risk Management Violence Risk Assessment Scheme; Level of Supervision Inventory–Revised; Violence Risk Assessment Guide; Statistical Information on Recidivism scale; and Psychopathy Checklist–Revised). Third-generation instruments, dynamic risk factors, and file review plus interview methods had the advantage in predicting violent recidivism. Second-generation instruments, static risk factors, and use of file review were the strongest predictors of institutional violence. Measures derived from criminological-related theories or research produced larger effect sizes than did those of less content relevance. Additional research on existing risk instruments is required to provide more precise point estimates, especially regarding the outcome of institutional violence.

Keywords: risk assessment; violence; meta-analysis; adult offenders; forensic patients; recidivism; misconduct

Assessments of violence risk should play a central role in decision making pertaining to sentencing, release, case management, and the selection of rehabilitation methods to achieve risk reduction (Andrews & Bonta, 2006; Heilbrun, 1997). The ability to assess risk is facilitated by the use of structured, empirically derived, and theoretically driven instruments (Andrews, Bonta, & Wormith, 2006; Grove, Zald, Lebow, Snitz, & Nelson, 2000). Despite the availability of violence-specific risk tools and other measures associated with criminality and aggression, there are relatively few meta-analytic comparisons of their predictive validity for predicting risk, identifying risk-reduction targets, and monitoring changes in risk level. Comparisons of this nature are necessary to adequately inform professional practice parameters concerning the selection of instruments for inclusion in
