*Population Genetics of Forest Trees* W.T. Adams, Steven H. Strauss, Donald L. Copes, A.R. Griffin, 1992-11-30 Tropical climates which occur between 23° 30' N and S latitude Jacob 1988 encompass a wide variety of plant communities Hartshorn 1983 1988 many of which are diverse in their woody floras Within this geographic region temperature and the amount and seasonality of rainfall define habitat types UNESCO 1978 The FAO has estimated that there are about 19 million km<sup>2</sup> of potentially forested area in the global tropics of which 58% were estimated to still be in closed forest in the mid 1970s Sommers 1976 UNESCO 1978 Of this potentially forested region 42% is categorized as dry forest lifezone 33% is tropical moist forest and 25% is wet or rain forest Lugo 1988 The species diversity of these tropical habitats is very high Raven 1976 in Mooney 1988 estimated that 65% of the 250 000 or more plant species of the earth are found in tropical regions Of this floristic assemblage a large fraction are woody species In the well collected tropical moist forest of Barro Colorado Island Panama 39.7% 481 of 1212 species of the native phanerogams are woody arborescent species Croat 1978 Another 21.9% are woody vines and lianas Southeast Asian Dipterocarp forests may contain 120-200 species of trees per hectare Whitmore 1984 and recent surveys in upper Amazonia recorded from 89 to 283 woody species 10 cm dbh per hectare Gentry 1988 Tropical communities thus represent a global woody flora of significant scope

*Population Genetics in Forestry* Hans-Rolf Gregorius, 2013-03-13 When we consider the main object of forestry the tree it immediately becomes clear why experimental population geneticists have been so hesitant in making this object a primary concern of their research Trees are very long living organisms with generation intervals frequently exceeding those of their investigators by multiples They virtually exclude therefore application of the classical methods of population genetics since these are based on observing genetic structures over generations This situation where the limits set to observation are so severe particularly requires close cooperation between theory and experiment It also requires careful consideration of results obtained for organisms other than trees in order to gain additional insights by comparing the results for trees with those for other organisms Yet the greatest challenge to population and ecological genetics probably originates from the fact that forests are very likely to be the most complex ecosystems of all even in some cases where they are subject to intense management This complexity which equally comprises biotic and abiotic factors varying both in time and space makes extremely high demands on the adaptational capacity and thus flexibility of the carriers of such an ecosystem Longevity combined with immobility during the vegetative phase however appears to contradict the obvious necessity of adaptational flexibility in forest tree populations when compared with short lived and or mobile organisms

**Forest Conservation Genetics** Andrew Young, David Boshier, Timothy Boyle, 2000-07-24 Forest management must be sustainable not only in ecological economic and social but also genetic terms Many forest managers are advocating and developing management strategies that give priority to

conserving genetic diversity within production systems or that recognise the importance of genetic considerations in achieving sustainable management Forest Conservation Genetics draws together much previously uncollected information relevant to managing and conserving forests The content emphasises the importance of conserving genetic diversity in achieving sustainable management Each chapter is written by a leading expert and has been peer reviewed Readers without a background in genetics will find the logical sequence of topics allows easy understanding of the principles involved and how those principles may impact on day to day forest planning and management decisions The book is primarily aimed at undergraduate students of biology ecology forestry and graduate students of forest genetics resource management policy and or conservation biology It will prove useful for those teaching courses in these fields and as such help to increase the awareness of genetic factors in conservation and sustainable management in both temperate and tropical regions

**Introduction to Quantitative Genetics in Forestry** Gene Namkoong, 1981 Tropical Forest Genetics Reiner Finkeldey, Hans Heinrich Hattmer, 2006-11-22 This book is intended to provide information on fundamental genetic processes in tropical forests It is based on lecture notes by the authors prepared for postgraduate students mainly from tropical countries of the M Sc course Tropical and International Forestry at the Faculty of Forest Sciences and Forest Ecology Georg August University Göttingen Germany The intended readership is students researchers and practitioners interested in the genetic variation of species in particular forest trees living in complex forest ecosystems in the tropics Particular emphasis is placed on the human impact on forest genetic resources in the tropics Readers should be familiar with basics of classical and molecular genetics such as the structure and function of DNA double helix structure replication polypeptide synthesis transcription and translation and the transmission of genetic information during sexual reproduction Mendel's rules This knowledge is easily available from recently published genetics textbooks we recommend the book by Griffiths et al 2000 The development of biochemical and molecular marker techniques and their application to species of tropical forests have greatly improved our knowledge of genetic variation patterns of wild plants in the tropics during the last two decades Many examples in this book are based on gene marker techniques Introduction to Forest Genetics Jonathan Wright, 2012-12-02 Introduction to Forest Genetics examines some of the basic genetic concepts typically used in forestry and tree improvement studies including Mendelian and population genetics It also describes techniques that are generally useful in tree improvement work including individual tree selection and breeding provenance testing species and racial hybridization and introduction of exotics Organized into 19 chapters this volume begins with an overview of forest genetics and problems associated with forest genetics It then discusses concepts from basic genetics including chromosome structure and function DNA and RNA non-genetic inheritance and genotype versus phenotype Other chapters focus on inbreeding complete elimination of homozygous recessive trees mutation and migration and controlled pollination and vegetative propagation The book also covers the establishment and measurement of test plantations general principles and methods of

selective breeding choice of breeding method and type of seed orchard heritability and genetic gain geographic variation in Scotch pine and American trees species and racial hybridization chromosome studies and polyploidy and haploidy breeding This book is a valuable resource for foresters professional tree breeders and those with or without previous training in genetics or forestry

**Genetics of Forest Ecosystems** K. Stern,L. Roche,2012-12-06 Throughout the world natural forest ecosystems have been and are being massively disrupted or destroyed The boreal forests of Canada are no more immune to man s intervention than the tropical rain forests of Africa and the day is rapidly approaching when natural forest ecosystems undisturbed by man will be found only as remnants in national parks and other protected areas Yet where they continue to exist these ecosystems are an extraordinarily rich though relatively neglected source of data that illuminate many aspects of the classic theory of evolution The subject matter of this book is not however confined to natural forest ecosystems Forest ecosystems under varying degrees of management and man made forests are also a rich source of information on ecological genetics In general however it can be said that the published evidence of this fact has not yet significantly penetrated the botanical literature All too frequently it is confined to what might be termed forestry journals It is hoped that this book will to some extent redress the balance and draw attention to a body of published work which not only provides a basis for the rational management and conservation of forest ecosystems but also complements the literature of ecological genetics and evolution The first draft of Chapters I to V was written in German by the senior author and translated by E K MORGENSTERN of the Canadian Forestry Service
