

Quasi-Stellar Objects

- It was not the 15% redshift that puzzled Schmidt, galaxies were already known with much larger redshifts, but rather the brightness of 3C273.
- 3C273 was a thousand times brighter than even a very luminous galaxy would appear at a distance of 2 billion light years

Studies of the Physical Properties of Quasi-stellar Objects Paul Arnold Feldman, STANFORD UNIV CALIF INST FOR PLASMA RESEARCH., 1969 The work deals with quasi stellar objects as cosmologically distant entities in accord with the currently accepted interpretation of their redshifts It has been attempted to understand the physical properties of these objects within the basic framework of the galactic flare model of Sturrock which was originally developed in connection with a theory for the major explosions associated with quasars and radio galaxies The primary aim of the work has been to explain the enormous luminosities especially in the infrared that must be produced by cosmologically distant quasars and certain active galaxies The resultant explanation turns out to be successful not only in this respect but also in leading to a satisfactory model encompassing a number of other aspects of the quasar phenomenon A specific model for the quasar archetype 3C 273B is discussed quantitatively It is shown that the physical characteristics of the line emission region and of the meter wave radio region are consistent with those adopted for the source of strong infrared continuum radiation Suggestions are made for possible observations that could help to verify the proposed model Author **Mitteilungen der Astronomischen Gesellschaft** ,1967 **Mitteilungen - Sternwarte Babelsberg** Sternwarte Babelsberg (Germany),1971 Astronomische Nachrichten ,1971 *Mitteilung* Universitäts-Sternwarte zu Bonn,
