• After more than 12 years of development, the ninth edition of the Present State Examination (PSE-9) was published, together with associated instruments and computer algorithm, in 1974. The system has now been expanded, in the framework of the World Health Organization/Alcohol, Drug Abuse, and Mental Health Administration Joint Project on Standardization of Diagnosis and Classification, and is being tested with the aim of developing a comprehensive procedure for clinical examination that is also capable of generating many of the categories of the *International Classification of Diseases*, 10th edition, and the *Diagnostic and Statistical Manual of Mental Disorders*, revised third edition. The new system is known as SCAN (Schedules for Clinical Assessment in Neuropsychiatry). It includes the 10th edition of the PSE as one of its core schedules, preliminary tests of which have suggested that reliability is similar to that of PSE-9. SCAN is being field tested in 20 centers in 11 countries. A final version is expected to be available in January 1990.
(Arch Gen Psychiatry. 1990;47:589-593)

Schedules for Clinical Assessment in Neuropsychiatry (SCAN) has been developed with the encouragement and support of the Task Force on Psychiatric Assessment Instruments. This task force was established within the framework of a joint World Health Organization (WHO)/Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA) project that is aimed at improving the accuracy and reliability of measurement and classification of psychiatric disorders.¹ The project's chief goal is to foster the development of techniques that can be used to study psychopathology across nations, regions, and cultures so as to create the basis for collaborative studies that will examine the causes, risk factors, outcomes, and consequences of mental disorders.

Two such techniques developed under the sponsorship of the task force are the Composite International Diagnostic Interview (CIDI) and SCAN. The CIDI is based on the National Institute of Mental Health Diagnostic Interview Schedule, modified for international use in various ways, and has adopted certain features of the ninth edition of the Present State Examination (PSE-9).²

The descriptive article on the CIDI provides a useful overview of the reasoning behind the approach of the task force and of the work necessary to create a method that is sufficiently comprehensive to provide *International Classification of Diseases*, 10th edition (*ICD-10*), and the *Diagnostic and Statistical Manual of Mental Disorders*, revised third edition (*DSM-III-R*) diagnoses, and yet is reliable and practical enough to be

used in multinational comparative studies. This article does not cover this ground again but is devoted to describing the characteristics of the development version of SCAN that is now being tested in field trials. It is necessary first to describe the instruments from which SCAN evolved.

DEVELOPMENT OF THE PSE-INDEX OF DEFINITION-CATEGORY SYSTEM

One of the core components of SCAN is PSE-10. The early development of the PSE has been described in an article that also restates its underlying principles.³ The interview is based on clinical "cross-examination" with the aim of discovering whether each of a comprehensive list of symptoms is present and, if so, with what degree of severity. This decision is made by the examiner, not by the respondent. For most symptoms, a form of questioning is suggested, although the interviewer is free to depart from this and from the order of questioning if necessary to obtain clarity. The time period recommended for PSE-9 is limited, usually to 1 month, because results of experiments suggested that recall of subjective experience over a longer period was often not satisfactory. However, researchers are free to depart from this practice if they wish, provided they specify the period used when publishing their results. Almost all respondents have found the interview style perfectly acceptable.

The interview had its origins in studies conducted in the late 1950s and went through five editions before the first article was published in 1967.⁴ The seventh and eighth editions were used in two large-scale international studies, the United States-United Kingdom Diagnostic Project⁵ and the International Pilot Study of Schizophrenia.^{6,7} It should be emphasized that, until then, the PSE had been used chiefly by a relatively small number of research psychiatrists well trained in phenomenology. It was not a "diagnostic" instrument, although it was noted that, by describing the phenomena comprehensively, precisely, and accurately, diagnostic reliability increased markedly without employing standardized rules.^{8,9,10}

The International Pilot Study of Schizophrenia involved data collection by a much more diverse group of psychiatrists, educated in various schools of clinical thought, and it became obvious that differential definitions must be written in a glossary, training courses must be organized, and classifying algorithms (the CATEGO computer program) must be written. Moreover, a syndrome checklist, based on PSE symptoms, had to be designed to allow the rating of previous episodes of disorder, and an etiology schedule to allow the coding of possible causes and pathologic conditions.

The CATEGO program could be used with PSE-9 or the syndrome checklist, producing from each, as its final stage, a reference classification of 50 categories that could, under care-

Archives suisses de neurologie et de psychiatrie, 1991. *New Models of Care for Patients with Severe Mental Illness – Bridging In- and Outpatients* Martin Heinze, Yasser Khazaal, Alexandre Wullschleger, 2018-03-13. Over the past years, psychiatric services have been continuously faced with the challenge of providing comprehensive care to people suffering from severe mental illnesses. Legal and conceptual advances like the UN convention on the rights of persons with disabilities or the concept of recovery have rendered this challenge more actual and urgent than ever. However, psychiatric institutions often show only low levels of cooperation and integration between their different services. Hence, they need to develop new ways of bridging all sectors of care in order to help people most in need on their way to recovery and full inclusion in society. In this research topic, European researchers and clinicians present new ways of dealing with this essential issue by developing strategies and interventions on both institutional and non-institutional levels. The nine contributions of this ebook thus reflect actual clinical and conceptual considerations. They all aim at improving quality of care and providing adequate support to people suffering from severe mental illness.

The Interview for the Retrospective Assessment of the Onset of Schizophrenia and Other Psychoses (IRAOS) allows systematic research on the onset of schizophrenia. The social course, symptoms, disability, and treatment from the first signs or indicators of illness until the time of interview are assessed. In addition to studying the onset and early course of schizophrenia and other non-organic psychotic disorders, the present revised version of the IRAOS can be used in research on affective psychoses. In the socio-demographic part of the instrument, the entire life of the patient is thoroughly recorded with the help of the so-called continuity items. With these items based on six key social roles, breaks in social development and their causes can be assessed. The episodes part provides information on
