Scanning Tunneling Microscopy II Roland Wiesendanger, Hans-Joachim Güntherodt, 2013-03-08 Scanning Tunneling Microscopy II like its predecessor presents detailed and comprehensive accounts of the basic principles and the broad range of applications of STM and related scanning probe techniques The applications discussed in this volume come predominantly from the fields of electrochemistry and biology In contrast to those in STM I these studies may be performed in air and in liquids The extensions of the basic technique to map other interactions are described in chapters on scanning force microscopy magnetic force microscopy and scanning near field optical microscopy together with a survey of other related techniques Also discussed here is the use of a scanning proximal probe for surface modification Together the two volumes give a comprehensive account of experimental aspects of STM and provide essential reading and reference material In this second edition the text has been updated and new methods are discussed

High-Resolution Imaging and Spectrometry of Materials Frank Ernst,Manfred Rühle,2013-03-09 The characterisation of materials and material systems is an essential aspect of materials science A few decades ago it became obvious that because the properties of materials depend so critically on the microstructure of their components this characterisation must be determined to the atomic level This means that the position as well as the nature of individual atoms has to be determined at critical regions close to defects such as dislocations interfaces and surfaces The great impact of advanced transmission electron microscopy TEM techniques became apparent in the area of semiconducting materials where the nature of internal interfaces between silicon and the corresponding silicides could be identified and the results used to enhance the understanding of the properties of the compounds studied At that time advanced TEM techniques existed predominantly in the US However advanced TEM instrumentation was not available in the materials science and solid state science communities in Germany This gap was bridged by the late Peter Haasen who after a visit to the US initiated a Priority Programme on Microstructural Characterisation at the Volkswagen Foundation Hannover The programme was in effect from 1985 to 1997 and supported a wide range of research projects from fundamental trendy innovative projects to projects in applied materials science
