Scientific Computing in Electrical Engineering SCEE 2010

Bastiaan Michielsen, Jean-René Poirier, 2012-01-06 Selected from papers presented at the 8th Scientific Computation in Electrical Engineering conference in Toulouse in 2010 the contributions to this volume cover every angle of numerically modelling electronic and electrical systems including computational electromagnetics circuit theory and simulation and device modelling On computational electromagnetics the chapters examine cutting edge material ranging from low frequency electrical machine modelling problems to issues in high frequency scattering Regarding circuit theory and simulation the book details the most advanced techniques for modelling networks with many thousands of components Modelling devices at microscopic levels is covered by a number of fundamental mathematical physics papers while numerous papers on model order reduction help engineers and systems designers to bring their modelling of industrial scale systems within the reach of present day computational power Complementing these more specific papers the volume also contains a selection of mathematical methods which can be used in any application domain

Scattering of Electromagnetic Waves Leung Tsang, Jin Au Kong, Kung-Hau Ding, 2000-07-31

Electromagnetic wave scattering is an active interdisciplinary area of research with myriad practical applications in fields ranging from atomic physics to medical imaging to geoscience and remote sensing In particular the subject of wave scattering by random discrete scatterers and rough surfaces presents great theoretical challenges due to the large degrees of freedom in these systems and the need to include multiple scattering effects accurately In the past three decades considerable theoretical progress has been made in elucidating and understanding the scattering processes involved in such problems Diagrammatic techniques and effective medium theories remain essential for analytical studies however rapid advances in computer technology have opened new doors for researchers with the full power of Monte Carlo simulations in

the numerical analysis of random media scattering Numerical simulations allow us to solve the Maxwell equations exactly without the limitations of analytical approximations whose regimes of validity are often difficult to assess Thus it is our aim to present in these three volumes a balanced picture of both theoretical and numerical methods that are commonly used for tackling electromagnetic wave scattering problems While our book places an emphasis on remote sensing applications the materials covered here should be useful for students and researchers from a variety of backgrounds as in for example composite materials photonic devices optical thin films lasers optical tomography and X ray lithography Introductory chapters and sections are also added so that the materials can be readily understood by graduate students We hope that our book would help stimulate new ideas and innovative approaches to electromagnetic wave scattering in the years to come
