Focus on Bipolar

Disorder Research Malcomb R. Brown,2005 In a world permeated with stress bipolar disorders have become an all too common occurrence There are millions of people throughout the world suffering from this disorder Bipolar disorder also known as manic depressive illness is a brain disorder that causes unusual shifts in a person s mood energy and ability to function Different from the normal ups and downs the symptoms of bipolar disorder are severe They can result in damaged

relationships poor job or school performance and even suicide The primary psychological factor implicated in the manifestation of bipolar disorder is stressful life events These can range from a death in the family to the loss of a job from the birth of a child to a move Once the disorder is triggered and progresses it seems to develop a life of its own State of the art analyses are presented in this new and significant book The two poles of bipolar disorder are mania and depression

Bipolar Affective Disorders Jörg Walden, Dr. Heinz Grunze, 2004 Bipolar disorder has increasingly become a main focus of interest in psychiatry This is reflected by the obvious success of the 1st edition of this book by Walden and Grunze Due to both the scientific and therapeutic progress it appears now necessary to have this revised version of the book Concerning therapeutic concepts major progress has been made with the introduction of new antiepileptic drugs such as lamotrigine and atypical antipsychotics to the treatment portfolio of bipolar disorder But also the scientific evaluation of psychotherapies as cognitive behavioural therapy and psychoeducation constitutes a substantial progress It becomes clear that modern treatment concepts should integrate both pharmacological and non pharmacological treatment modalities However despite the rapid increase of knowledge this book is still designed to be a quick reference on the causes and treatment of bipolar disorder and I hope that it will be a useful tool for the daily clinical practice Linking Treatment Target Identification to

The 1990s appropriately termed the decade of the brain witnessed unprecedented advances in our knowledge of psychiatric neuroscience Yet with every advance we realized afresh that we were still in the beginning stages of a much longer journey This text chronicles the next step of that journey Structured around a proven teaching methodology that uniquely integrates the clinical aspects of psychiatric disorders with their neurobiology this volume begins with two introductory chapters on functional neural circuitry and neural signaling pathways The remaining six chapters present current knowledge on the neuroanatomic and neurochemical mechanisms underlying schizophrenia addiction anxiety depression bipolar disorder and dementia Alzheimer s disease For clarity and consistency each chapter features the same four divisions clinical presentation neural circuitry signaling pathways and psychopharmacology as they relate to Schizophrenia which reviews studies of the neural basis of schizophrenia and describes how the cortex the thalamus the basal ganglia and the medial temporal lobe work together during normal brain function and then how each is perturbed in psychosis Addiction which focuses on the consequences of psychoactive substance use including compulsive practices e g eating sex Internet browsing that might also involve the same brain circuits and signaling pathways Of exceptional value are two unique illustrations that capture for the first time much of what we know about the anatomy and neurochemistry underlying the behavioral symptoms of addiction Anxiety which presents current hypotheses regarding neurocircuitry and signaling pathways for the three best studied from a neurobiologic perspective anxiety disorders panic disorder posttraumatic stress disorder and obsessive compulsive disorder Depression which offers evidence

for the involvement of highly interconnected cortical and limbic structures such as the prefrontal cortex medial thalamus amygdala ventral striatum hippocampus and the hypothalamic pituitary adrenal axis in unipolar major depression and suggests target areas such as the cAMP pathway for study in the development of new antidepressants Bipolar disorder which shows that specific abnormalities in signal transduction pathways including protein kinase activity G protein levels and gene expression are unique to bipolar patients concluding that the actions of lithium and anticonvulsants on intracellular signaling pathways provide a new paradigm for novel pharmacological interventions Dementia and Alzheimer's disease which details current findings on neurofibrillary degeneration relevant genes and proteins pathogenesis metabolic decline defective cell repair and A toxicity and treatment strategies neurotransmitter replacement and neuroprotective and regenerative approaches Discusses frontotemporal dementia dementia with Lewy bodies Parkinson's disease and vascular dementia Meticulously researched and clearly written by 15 contributors all recognized experts from leading research and teaching institutions in the United States this compact and extensively illustrated volume stands out in the literature because it combines readability and practicality with the breadth and depth typically found only in far lengthier works Psychiatric practitioners residents and students alike will welcome this informative easy to read text which will also be of special interest to mental health and pharmaceutical industry professionals and of general interest to anyone who wants to know more about the biology of psychiatric illness
