takes us on a detailed but highly accessible scientific journey providing startling insights into the nature of human aging. Twenty years ago there was still considerable debate of the nature of human aging with a variety of competing theories in play. But scientific consensus is forming around the telomere theory of aging. The essence of this theory is that human aging is the result of cellular aging. Every time a cell reproduces its telomeres, the tips of the chromosomes shorten. With every shortening of the telomeres, the cell's ability to repair its molecules decreases. It ages. Human aging is the result of the aging of the body's trillions of cells. But some of our cells don't age. Sex cells and stem cells can reproduce indefinitely without aging because they create telomerase. Telomerase re-lengthens the telomeres, keeping these cells young. The Telomerase Revolution describes how telomerase will soon be used as a powerful therapeutic tool with the potential to dramatically extend life spans and even reverse human aging. Telomerase-based treatments are already available and have shown early promise, but much more potent treatments will become available over the next decade. The Telomerase Revolution is the definitive work on the latest science on human aging, covering both the theory and the clinical implications. It takes the reader to the forefront of the upcoming revolution in human medicine.

[Aging](#) Michael Fossel, 2024-02-29 [Aging How Aging Works How We Reverse Aging and Prospects for Curing Aging Diseases](#) explains the process of aging beyond mere entropy, exposing it as a complicated and dynamic process that undercuts maintenance and permits age-related disease. With a deeper understanding of the aging process, intervention becomes both easy to understand and clinically feasible. With a solid academic approach, this proposed book builds upon the substantial work published over the past 20 years, citing the newest data, up-to-date models based upon that data, and the implications for improved clinical intervention, including recent developments in gene and cell therapy. Coverage of age-related diseases includes neurodegenerative, cardiovascular, bone and joint, immune system, renal, pulmonary, and skin aging. Future directions of the field focus on interventions, including a summary of previous attempts to intervene in aging and age-related disease, the status of current research, and proposed biotech interventions, as well as their potential obstacles, risks, and benefits. This is the perfect reference for scientists, clinicians, and researchers interested in the translational research opportunities such as drug discovery, pharmacogenetics, and experimental therapeutics, not only summarizing where the field stands but giving a clear and cogent view of where clinical medicine is going in the next decade. Provides a sophisticated, accurate, and clear explanation of aging. Gives a clear explanation of the fundamental role of cell aging in age-related disease. Offers a unified model for the role of epigenetic and telomere changes in cell aging. Outlines effective approaches to intervention in the fundamental aging process. Introduces upcoming interventions intended to both cure and prevent age-related diseases.
