The Complete Book on Biodegradable Plastics and Polymers (Recent Developments, Properties, Analysis, Materials & Processes) NIIR Board of Consultants & Engineers, 2006-10-01 Biodegradable plastics made with plant based materials have been available for many years The term biodegradable means that a substance is able to be broken down into simpler substances by the activities of living organisms and therefore is unlikely to persist in the environment There are many different standards used to measure biodegradability with each country having its own The requirements range from 90 per cent to 60 per cent decomposition of the product within 60 to 180 days of being placed in a standard composting environment They may be composed of either bio plastics which are plastics whose components are derived from renewable raw materials or petroleum based plastics which contain additives Biodegradability of plastics is dependent on the chemical structure of the material and on constitution of the final product not just on the raw materials used for its production Polyesters play a predominant role as biodegradable plastics due to their potentially hydrolysable ester bonds Bio based polymers are divided into three categories based on their origin and production polymer directly extracted from biomass polymers produced by classical chemical synthesis using renewable biomass monomer and polymers produces by microorganisms or genetically modified bacteria In response to public concern about the effects of plastics on the environment and in particular the damaging effects of sea litter on animals and birds legislation is being enacted or is

Kresta, 2012-12-06 Ever since the beginning of the plastics and rubber industry it was realized that useful products could be produced only if certain additives were incorporated into polymers With the help of these additives when physically dispersed in a polymer matrix it has been possible to improve stability against thermal oxidative UV hydrolytic and biological degradation mechanical properties flammability cost and processibility of plastics The enormous growth of the volume of plastics consumed by modern society and new application areas for plastics have created a demand for new better additives and better understanding of their functions in polymer systems As a result of these trends there is a need for sharing of

information on progress achieved in the area of polymer additives among engineers and scientists of the plastics industry and academia This book is based on expanded and updated papers originally presented at the International Symposium on Polymer Additives which was held in Las Vegas Nevada and was sponsored by the American Chemical Society Division of Polymeric Materials Science and Engineering The book is divided into five parts which cover advances in various areas of polymer additives The first part is devoted to the progress in understanding of UV degradation and stabilization of various polymers Oxidation degradation and stabilization of plastic materials is covered in the second part New developments in the stabilization of PVC are presented in the third part
