

Inside our planet

As Earth cooled, most of it turned to solid rock. It formed layers, with the **hottest** material at the **center** (the **core**), surrounded by a **deep, rocky mantle** and a **thin, brittle crust**. Nuclear reactions inside the planet make the rocks much **hotter** than their **normal melting points**, but **intense pressure** keeps the rock **solid**, except for the **outer core**, which is **liquid**.

THE CORE

Most of the planet's weight is concentrated in the core, which is mostly iron mixed with nickel. The inner core is solid, but surrounded by a liquid outer core. Together, they form a metallic ball almost 4,374 miles (7,039 km) across—roughly the size of Mars. Some meteorites are made of these same metals, and may be fragments of shattered planet cores.

● IRON METEORITES

Not everyone knows they exist. The Earth has a variety of types of iron, it probably came from the core of a planet that died long ago.

THE MANTLE

The core is surrounded by a mass of solid rock called the mantle. It is rich in iron and very heavy, but not as heavy as the metallic core. The mantle rock is extremely hot, and this makes it **malleable**, like modeling clay. The intense heat deep within the planet keeps the mantle moving very slowly. Its currents drive **volcanoes** and **earthquakes**.

The mantle is a ball of molten rock and is extremely heavy.

The inner mantle is the hottest, but the outer mantle is the most plastic.

The inner mantle is a solid, but the outer mantle is the most plastic.

The upper mantle is the hottest, but the outer mantle is the most plastic.

Earth is a mass of scorching hot rock and metal with a thin, brittle shell.

PRESSURE AND HEAT

The rock deep within the planet is far hotter than molten lava, but it's kept solid by intense pressure. It's similar to a bubble of soda. As long as the cap is on, the high pressure inside the bottle keeps it liquid. But if you remove the pressure, some of the liquid turns to gas that flows out of the top.

EARTHQUAKE CLUES

We only know what lies beneath Earth's crust by studying the **waves** that radiate from earthquakes. These waves pass at various speeds through the planet, but can be blocked by its different layers. The science of interpreting these earthquake clues is called **seismology**.

● SEISMIC WAVES

Some waves (P-waves) can pass through the core, but others (S-waves) cannot and have to travel in the mantle.

FAST FACTS

Diameter of the inner core: 1,215 miles (1,954 km)
Depth of the outer core: 1,800 miles (2,896 km)
Depth of the mantle: 1,800 miles (2,896 km)
Depth of the crust: 3–20 miles (5–32 km)
