

HOW DOES GENETIC ENGINEERING WORK?

Scientists use various methods to add genes to an organism's DNA. One method to transfer genes uses a soil bacterium.

The soil bacterium *Agrobacterium tumefaciens* has a ring of DNA that naturally inserts itself into the DNA of plant cells and causes tumors.

plant

tumor

① The tumor-causing gene is cut out of the bacterium's DNA. The desired gene from the donor organism is pasted into the DNA in its place.

② The DNA is put back into a bacterial cell. The cell is put in a nutrient broth, where it multiplies. Each new bacterial cell has the new gene.

③ A piece of leaf is placed in the nutrient broth. The DNA with the new gene enters some of the plant cells.

④ Leaf cells with the new gene are put in a special growth medium where they grow into complete plants. Every cell in the new plant contains the new gene.

⑤ When the plants mature, they make seeds that carry the new gene.

University of California Berkeley California 94720 It is evident by now that there is a great deal of interest in exploiting the new technologies to genetically engineer new forms of plants A purpose of this meeting is to assess the possibilities The papers that follow are concerned with the analysis of single genes or small gene families We will read about genes found within the nucleus plastids and bacteria which are responsible for agriculturally important traits Given that these genes can be isolated by recombinant DNA techniques there are two possible strategies for plant engineering One involves isolating a gene from a cultivated plant changing it in a specific way and then inserting it back into the same plant where it produces an altered gene product An example might be changing the amino acid composition of a seed protein so as to make the seed a more efficient food source A second strategy is to isolate a gene from one species and transfer it to another species where it produces a desirable feature An example might be the transfer of a gene which encodes a more efficient photosynthetic enzyme from a wild relative into a cultivated species There are three technical hurdles which must be overcome for either strategy to work The gene of interest must be physically isolated
