Bin-Jaliah, 2006 The carotid body initiates reflexes aimed principally at the homeostatic maintenance of blood gas tensions

This thesis tested the hypothesis that the carotid body is also a physiological glucosensor with a role in mediating exercise hyperpnoea. In anaesthetised rats insulin induced hypoglycaemia from ca 6.5 to 2.8 mmol L⁻¹ caused an ca two fold increase of oxygen consumption that was associated with a significant carotid body dependent increase in ventilation from ca 420 to 640 ml min⁻¹ kg⁻¹ without change in blood gas tensions. This hypoglycaemic hyperpnoea was associated with hypokalaemia and no alterations of ventilation or metabolism were observed in euglycaemic control studies thus excluding any role for K⁺ or insulin. During hypermetabolism a proportional augmentation of peripheral CO₂ gain measured from the phrenic electroneurogram during artificial ventilation was shown to maintain the arterial blood gas status. In vitro measurements of single fibre chemoafferent discharge showed that low glucose over a physiological range and during normoxia increased neither the carotid baseline discharge nor the CO₂ sensitivity. Taken together these results demonstrate that the carotid body is not a physiological sensor of glucose but augmentation of the carotid body chemosensitivity via an undetermined yet hypermetabolism related factor is most likely to be involved in exercise hyperpnoea.

Thermal Comfort Assessment of Clothing Ivana Špelić, Alka Mihelić-Bogdanić, Anica Hursa Šajatović, 2019-06-20. Providing detailed analysis of the thermal comfort assessment of clothing as the basis for developing standards, this book discusses the thermal protective role of clothing as a way of modelling heat transfer from the body, general thermal regulation of humans, and the importance of globally accepted test methods and standards to improve quality. New materials and discoveries in the study of thermal comfort necessitate the need for standard improvements and update. The development of international standards and the unification of testing methods is of crucial significance to ensure cost reduction and health protection. The book promotes instruments, methods, implementation of unified specifications, and the definition of standards so that a clear quality management system can be established for both production systems and testing methods. It discusses standards in ergonomics of the thermal environment, clothing thermal characteristics, and subjective assessment of thermal comfort, which allows for systematic control of the measuring methods and the services and final products that are distributed on the global market. This book is aimed at industry professionals, researchers, and advanced students working in textile and clothing engineering, comfort testing, and ergonomics. **Basic Science for Surgeons** Louis C.
