

❖ **Myofibrils**

The nuclei are pushed aside by long ribbonlike organelles, the myofibrils, which nearly fill the cytoplasm.

❖ **Light and dark bands**

Alternating dark and light bands along the length of the perfectly aligned myofibrils give the muscle cell as a whole its striped appearance.

❖ **Sarcomeres**

The myofibrils are actually chains of tiny contractile units called sarcomeres, which are aligned end to end like boxcars in a train along the length of the myofibrils.

❖ **Myofilaments**

There are two types of threadlike protein myofilaments within each of our "boxcar" sarcomeres.

The Physiology of Muscular Exercise Francis Arthur Bainbridge,1923 Skeletal Muscle Circulation Ronald J.

Korthuis,2011 The aim of this treatise is to summarize the current understanding of the mechanisms for blood flow control to skeletal muscle under resting conditions how perfusion is elevated exercise hyperemia to meet the increased demand for oxygen and other substrates during exercise mechanisms underlying the beneficial effects of regular physical activity on cardiovascular health the regulation of transcapillary fluid filtration and protein flux across the microvascular exchange vessels and the role of changes in the skeletal muscle circulation in pathologic states Skeletal muscle is unique among organs in that its blood flow can change over a remarkably large range Compared to blood flow at rest muscle blood flow can increase by more than 20 fold on average during intense exercise while perfusion of certain individual white muscles or portions of those muscles can increase by as much as 80 fold This is compared to maximal increases of 4 to 6 fold in the coronary circulation during exercise These increases in muscle perfusion are required to meet the enormous demands for oxygen and nutrients by the active muscles Because of its large mass and the fact that skeletal muscles receive 25% of the cardiac output at rest sympathetically mediated vasoconstriction in vessels supplying this tissue allows central hemodynamic variables e g blood pressure to be spared during stresses such as hypovolemic shock Sympathetic vasoconstriction in skeletal muscle in such pathologic conditions also effectively shunts blood flow away from muscles to tissues that are more sensitive to reductions in their blood supply that might otherwise occur Again because of its large mass and percentage of cardiac output directed to skeletal muscle alterations in blood vessel structure and function with chronic disease e g hypertension contribute significantly to the pathology of such disorders Alterations in skeletal muscle vascular resistance and or in the exchange properties of this vascular bed also modify transcapillary fluid filtration and solute movement across the microvascular barrier to influence muscle function and contribute to disease pathology Finally it is clear that exercise training induces an adaptive transformation to a protected phenotype in the vasculature supplying skeletal muscle and other tissues to promote overall cardiovascular health Table of Contents Introduction Anatomy of Skeletal Muscle and Its Vascular Supply Regulation of Vascular Tone in Skeletal Muscle Exercise Hyperemia and Regulation of Tissue Oxygenation During Muscular Activity Microvascular Fluid and Solute Exchange in Skeletal Muscle Skeletal Muscle Circulation in Aging and Disease States Protective Effects of Exercise References **Journal of Anatomy and Physiology** ,1878 An
