Physics of Luminous Blue Variables Kris Davidson, Anthony F.J. Moffat, Henny J.G.L.M. Lamers, 2012-12-06 A strange field of speculation is opened by this phenomenon here we have a star fitfully variable to an astonishing extent and whose fluctuations are spread over centuries apparently in no settled period and with no regularity of progression What origin can we ascribe to these sudden flashes and relapses What conclusions are we to draw as to the comfort or habitability of a system depending for its supply of light and heat on so uncertain a source J F W Herschel We can imagine at least that the study of Luminous Blue Variable stars began as the official court astrophysicists of Eridu speculated about a new 5000 years ago first magnitude star which persisted in their southern sky for several years 2 After that the topic languished for a while but now it has been renewed following recent observations by Blaeu P Cygni c 1600 and Herschel 1 Argus c 1840 More soberly it is only within the past few years that we have begun to understand LBV s and to recognize their coherence as a class Thus only a minority of astronomers are familiar yet with this relatively new topic whose potential implications are of great interest see below One purpose of this book we hope will be to provide an accessible overview of the subject for interested astronomers and astrophysicists in general

Luminous Stars in Nearby Galaxies Roberta M. Humphreys, 2020-12-10 Studies on the populations of luminous stars in nearby resolved galaxies have revealed a complex distribution in the luminosity temperature plane the HR diagram The fundamentals of massive star evolution are mostly understood but the roles of mass loss episodic mass loss rotation and binarity are still in question Moreover the final stages of these stars of different masses and their possible relation to each other are not understood The purpose of this volume is to provide a current review of the different populations of evolved massive stars The emphasis is on massive stars in the Local Group the Magellanic Clouds and the

nearby spirals M31 and M33 **Physics Briefs** ,1994 **Stellar Jets and Bipolar Outflows** L. Errico,Alberto A. Vittone,2012-12-06 In the last few years great improvements in the study of stellar jets and bipolar outflows have been achieved both observationally and theoretically High resolution observations at various frequencies radio IR optical and X ray of these features in different types of objects have shown a large variety of morphologies at all scales often revealing contrasting symmetries which do not allow straightforward kinematic interpretations valid for all cases In particular at present it seems very difficult to give a statistical definition of what the standard properties of jets and bipolar outflows are On the theoretical side the identification of physical processes capable of producing the observed rich morphological variety of jets and bipolar outflows and supporting them over long lifetimes is still controversial Furthermore several models are actively discussed in an attempt of reaching a complete understanding of the phenomenon The workshop provided an unique opportunity for both observers and theoreticians to gather together and produce an updated and exhaustive picture of the field In addition the meeting has been enriched by the presentation of some works on jets in external galaxies This topic was focused on what people working on stellar jets could learn from colleagues working on extragalactic jets and vice versa Invited papers were prepared with the aim of giving the state of the art about scientific subjects contributed papers and some selected poster papers presented on the contrary very recent results in the various fields **Mitteilungen der Astronomischen Gesellschaft** Astronomische Gesellschaft (Germany),1999 **Angular Momentum and Mass Loss for Hot Stars** L.A. Willson,R. Stalio,2012-12-06 Fundamental unsolved problems of stellar astrophysics include the effects of angular momentum on stellar structure and evolution the nature and efficiency of the processes by which angular momentum is redistributed within and lost from stars and the role that stellar rotation plays in enhancing or driving stellar mass loss There appears to be a qualitative change in the nature and efficiency of these mechanisms near spectral type FO hotter more massive stars typically retain more angular momentum at least until they reach the main sequence while cooler stars typically spin down quickly For the hotter stars recent work suggests a strong link between the type of pulsation behavior the mass loss rates and the rotation velocity If the same mechanisms are able to drive mass loss from the main sequence A stars as has recently been proposed then the current interpretations of a number of observations will be drastically affected e g the ages of clusters may be incorrect by up to a factor of two and the surface abundances of isotopes of He Li and Be may no longer give constraints on cosmological nucleosynthesis There are also effects on the evolution of the abundances of elements in the interstellar medium and on the general evolution of populations of stars Thus the questions of the mechanisms of angular momentum and mass loss of stars more massive than the sun is important not only for stellar studies but for the foundations of much of modern astrophysics **International Aerospace Abstracts** ,1999 Wisconsin Astrophysics ,1997 Nonisotropic and Variable Outflows from Stars Laurent Drissen,Claus Leitherer,Antonella Nota,1992 **Mitteilungen** Astronomische Gesellschaft (Germany),1990 The Impact of Binary Stars on Stellar Evolution Giacomo

Beccari, Henri M. J. Boffin, 2019-04-18 Stars are mostly found in binary and multiple systems with at least 50% of all solar like stars having companions this fraction approaches 100% for the most massive stars A large proportion of these systems interact and alter the structure and evolution of their components leading to exotic objects such as Algol variables blue stragglers and other chemically peculiar stars but also to phenomena such as non spherical planetary nebulae supernovae and gamma ray bursts While it is understood that binaries play a critical role in the Initial Mass Function the interactions among binary systems significantly affect the dynamical evolution of stellar clusters and galaxies This interdisciplinary volume presents results from state of the art models and observations aimed at studying the impact of binaries on stellar evolution in resolved and unresolved populations Serving as a bridge between observational and theoretical astronomy it is a comprehensive review for researchers and advanced students of astrophysics **Eta Carinae at the Millennium** Jon A.

Instabilities in Evolved Super- and Hypergiants Cornelis de Jager, 1992 Paperback This work deals with the general problem of atmospheric and internal instabilities of super and hypergiants in relation to their evolutionary phase New topics discussed are stellar variability in relation to the observed pulsations and shock waves Other important features are the discussion of dust formation maser emission and the relation of these phenomena to stellar winds The volume which contains invited reviews and contributed papers will appeal to astrophysicists research workers and graduate students **Reverse Acronyms, Initialisms, & Abbreviations Dictionary**, 2009 *Transactions of the International Astronomical Union* International Astronomical Union, 1992 **Evolutionary Phenomena in the Universe** P.
