

where there are specialised membranes called **nasal cavities**. The air enters there to warm and produce sounds, which are controlled and made by the muscles of the pharynx, larynx, trachea and lungs. The pharynx, nasally, orally cavity and paranasal sinuses also act as resonating chambers for sound.

Organisation of the Respiratory System

The respiratory system is divided into two zones:

- **The conducting zone:** This is a series of interconnected passageways that allows air to reach the lungs. No gaseous exchange occurs here. The function of the structures of this

zone is to transport air to the alveoli and to filter, warm and moisten it. Structures of the conducting zone include the nose, pharynx, larynx, trachea, and the bronchi and their smaller branches.

- **The respiratory zone:** This is where the exchange of gases occurs. The alveoli form the respiratory zone.

Functions of the nose is a nostril

- Inhaling air
- Filtering, warming and moistening air
- Resonating vibrating sound
- Acting as a resonating chamber for sound

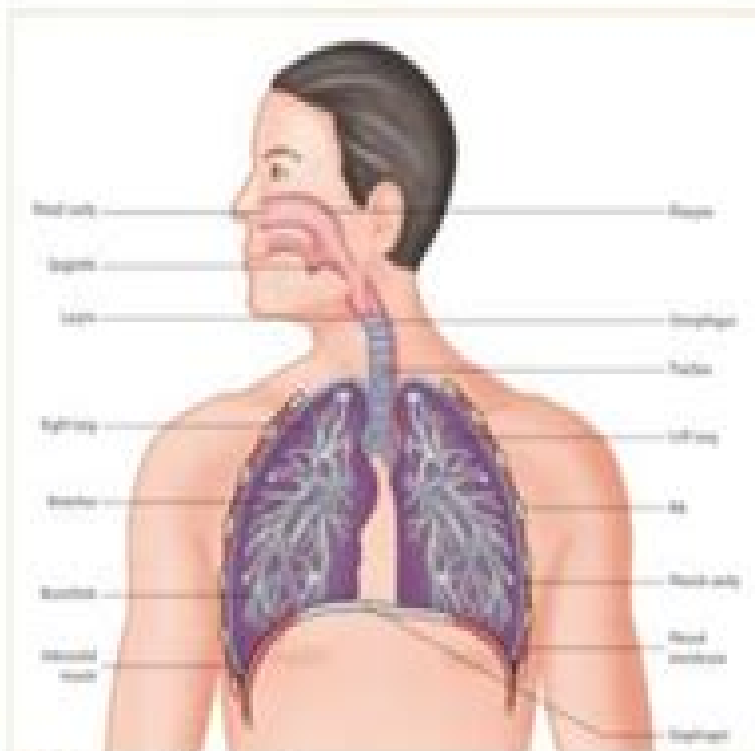

Figure 10.1 Structure of the respiratory system

Nose

As soon as the respiratory system through the nose, which is a framework of bone and hyaline cartilage that is covered by skin and lined internally with a mucous membrane.

The nose has the following structures:

- Two external nares, which are the openings to the nose and are commonly called the nostrils, inside the same are osseous horns that filter out large dust particles.
- A large internal cavity called the nasal cavity, which is divided into two by the septum.
- At the back of the nasal cavity are two internal nares (choanae), which are openings that connect the nasal cavity to the pharynx.

The nasal cavity contains:

- The olfactory receptors (receptors for the sense of smell).
- Five openings from the paranasal sinuses, these allow mucus to drain from the sinuses into the nasal cavity.
- The nasal concha (inferior, middle, which look like shelves protruding from the lower part of walls of the nasal cavity) the air which around them and, as it does so, it is warmed by the blood in their capillaries.

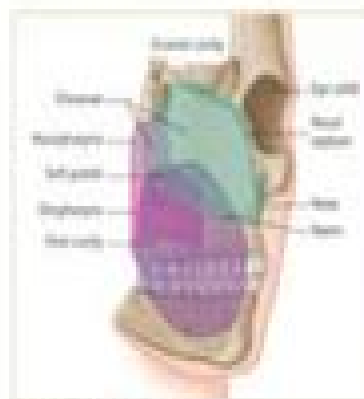

Figure 10.2 Structure of the nose

The nasal cavity is lined with:

- A mucous membrane that contains mucus, which warms the air and traps dust particles.
- Cilia that move the mucus from the nostrils toward the pharynx, where it can be swallowed or spit out.

Introduction

Structure and physiology in perspective

If the air being the respiratory system are damaged they cannot move that water move out of the system. The only way it can then be removed is through coughing. Substrates in cigarette smoke inhibit the movement of cilia and therefore coughing is not enough. A common cough people who smoke.

Introduction

Structure and physiology in perspective

What exactly are sinuses and why are they named as so much discomfort? Paranasal sinuses are air-filled spaces within the nasal and facial bones. They are located near the nasal cavity and serve as resonating chambers for sound when we speak. They are also lined with a mucous membrane and have tiny openings into the nasal cavity called ostia.

When you have a cold or an allergic reaction to something, the mucous membrane in the sinuses can swell and the mucus will be unable to pass through the tiny ostia and then as it should normally do. This can lead to inflammation, infection and a great deal of pain and discomfort. There are three pairs of paranasal sinuses, named after the bone in which they are located: the frontal, maxillary and ethmoid sinuses. There are also the sphenoid sinuses, which consist of many spaces inside the sphenoid bone.
