Perspectives In Biological Dynamics Th:

Computational Mind: A Complex Dynamics Perspective Vladimir G. Ivancevic, Tijana T. Ivancevic, 2007-05-16 This is a graduate level monographic textbook in the field of Computational Intelligence It presents a modern dynamical theory of the computational mind combining cognitive psychology artificial and computational intelligence and chaos theory with quantum consciousness and computation The book introduces to human and computational mind comparing and contrasting main themes of cognitive psychology artificial and computational intelligence

Perspectives on Organisms Giuseppe Longo, Maël Montévil, 2013-12-13 This authored monograph introduces a genuinely theoretical approach to biology Starting point is the investigation of empirical biological scaling including their variability which is found in the literature e g allometric relationships fractals etc The book then analyzes two different aspects of biological time first a supplementary temporal dimension to accommodate proper biological rhythms secondly the concepts of protension and retention as a means of local organization of time in living organisms Moreover the book investigates the role of symmetry in biology in view of its ubiquitous importance in physics In relation with the notion of extended critical transitions the book proposes that organisms and their evolution can be characterized by continued symmetry changes which accounts for the irreducibility of their historicity and variability The authors also introduce the concept of anti entropy as a measure for the potential of variability being equally understood as alterations in symmetry By this the book provides a mathematical account of Gould s analysis of phenotypic complexity with respect to biological evolution The target audience primarily comprises researchers interested in new theoretical approaches to biology from physical biological or philosophical backgrounds but the book may also be beneficial for graduate students who want to enter this field

Evolution from a Thermodynamic Perspective Carl F Jordan, 2021-11-26 Survival of the fittest is a tautology because those that are fit are the ones that survive but to survive a species must be fit Modern evolutionary theory avoids the problem by defining fitness as reproductive success but the complexity of life that we see today could not have evolved based on selection that favors only reproductive ability There is nothing inherent in reproductive success alone that could result in higher forms of life Evolution from a Thermodynamic Perspective presents a non circular definition of fitness and a thermodynamic definition of evolution Fitness means maximization of power output necessary to survive in a competitive world Evolution is the storage of entropy Entropy storage means that solar energy instead of dissipating as heat in the Earth is stored in the structure of living organisms and ecosystems Part one explains this in terms comprehensible to a scientific audience beyond biophysicists and ecosystem modelers Part two applies thermodynamic theory in non esoteric language to sustainability of agriculture and to conservation of endangered species While natural systems are stabilized by feedback agricultural systems remain in a mode of perpetual growth pressured by balance of trade and by a swelling population The constraints imposed by thermodynamic laws are being increasingly felt as economic expansion destabilizes resource systems on which expansion depends

Chaos In The Human Brain - Proceedings Of The Conference Dennis W Duke, W S Pritchard, 1991-10-31 This conference brought together scientists from diverse disciplines such as biomedical and electrical engineering mathematics physics neurology neuroscience psychophysiology and psychology to discuss the application of nonlinear dynamics in the study of brain function This is a relatively new field which involves measuring the properties of chaotic strange attractors in the human EEG Probably the earliest and still most exciting result in the field is that the more chaos the better is the rule in many physiological areas We have only the most speculative ideas about why the brain might be chaotic and what the implications are if it really is The potential is unimaginably large This volume will serve to inspire others to pursue research in this field and point the way in some promising directions

Nonlinearity in Living Systems: Theoretical and Practical Perspectives on Metrics of Physiological Signal Complexity Sladjana Spasić, Srdjan Kesić, 2019-06-28 The biological basis of physiological signals is incredibly complex While many types of research certainly appreciate molecular cellular and systems approach to unravel overall biological complexity in the recent decades the interest for mathematical and computational characterization of structural and functional basis underlying biological phenomena gain wide popularity among scientists Nowadays we witnessed wide range applications of nonlinear quantitative analysis that produced measures such as fractal dimension power law scaling Hurst exponent Lyapunov exponent approximate entropy sample entropy Lempel Ziv complexity as well as other metrics for predictions of onset and progression of many pathological conditions especially in the central nervous systems CNS In this Research Topic we seek to bring together the recent practical and theoretical advances in the development and application of nonlinear methods or narrower fractal based methods for characterizing the complex physiological systems at multiple levels of the organization We will discuss the use of various complexity measures and appropriate parameters for characterizing the variety of physiological signals up to the systems level There are multiple aims in this topic The recent advancement in the application of nonlinear methods for both normal and pathological physiological conditions is the first The second aim is to emphasize the more recent successful attempt to apply these methods across animal species Finally a comprehensive understanding of advantages and disadvantages of each method especially between its mathematical assumptions and real world applicability can help to find out what is at stake regarding the above aims and to direct us toward the more fruitful application of nonlinear measures and statistics in physiology and biology in general

Family Firms and Business Families in Cross-Cultural Perspective Tobias Koellner, 2023-02-13 This edited volume provides an anthropological study of family businesses and business families In previous research on family firms and business families the comparative cross cultural approach of anthropology has so far received little attention As a result family firms and business families are too often analyzed without considering cultural and kinship differences adequately Similarly although the topics of kinship and the economy are central to anthropological analysis research on family firms and business families has been a marginal topic only that lacks in depth discussions within anthropology This

volume breaks the mold by offering new empirical and theoretical insights into discussion about business families and family firms from a comparative cross cultural perspective It first addresses how the business family can be defined in different cultures and how kinship becomes understandable as a process and through doing family In this the book provides a systematic comparison of the connections between family kinship and economic activity in different cultures whereas many of the previous studies have concentrated on only one or a few regions or cultures It also shows the complexities and challenges when grounding the analysis of economic activity and entrepreneurship in cultural context

Mandell, Michael F. Shlesinger, 1987-01-01 **Chaos in Brain Function** Erol Başar, 1990-04-27 The analysis of deterministic chaos is currently an active field in many branches of research Mathematically all nonlinear dynamical systems with more than two degrees of freedom can generate chaos becoming unpredictable over a longer time scale The brain is a nonlinear system par excellence Accordingly the concepts of chaotic dynamics have found in the last five years an important application in research on compound electrical activity of the brain The present volume seeks to cover most of the relevant studies in the newly emerging field of chaotic attractors in the brain This volume is essentially a selection and reorganization of contributions from the first two volumes in the Springer Series in Brain Dynamics which were based on conferences held in 1985 and 1987 in Berlin It also includes a survey of progress in the recording of evoked oscillations of the brain both at the cellular and EEG levels and b an agenda for research on chaotic dynamics Although the first publications pointing out evidence of chaotic behavior of the EEG did not appear until the beginning of 1985 the presence of the pioneering scientists in this field gave the participants at the first conference volume 1 a strong impulse toward this field For me as conference organizer having been for a long time active in nonlinear EEG research the integration of this topic was self evident however the enthusiasm of the conference participants was greater than expected **Bio-Dynamic Gardening and Farming**

Cultural Perspectives on Biological Knowledge Troy Duster, Karen Garrett, 1984 Scholars remain locked in a battle over the relative importance of heredity and environment for such diverse matters as human intelligence female institution and racial stratification The present collection is an attempt to contribute to the quality of this discussion and focuses not only on the matter of relative weights but the matter of interaction Most of the contributions deal with the quality and character of the connection between the two Four essays focus upon what is now known about this friendship in several areas of practical and theoretical significance The authors reach beyond the caveat that both are important and indicate how and why there is a relationship of some complexity **Modeling and Simulation, Volume 19** Marlin H. Fractals and Chaos Simplified for the Life Sciences Larry S. Liebovitch,1998 There is a growing interest on the part of undergraduate and graduate students and investigators in applying fractals and chaos nonlinear dynamics to a variety of problems in biology and medicine This book explains fractals and chaos and illustrates their use with examples from biomedical research The author presents the material in a unique style that doesn t require a strong background in mathematics The ideas are presented in a straightforward way without technical jargon One concept at a time is explained in a set of facing pages with text on the left page and graphics on the right page The graphics pages can be copied directly on to transparencies for teaching **Bio-dynamics** ,2002 **The Characterization of Rat Brain Tyrosine Hydroxylase and Rat Locomotor Behavior** Patrick Victor Russo,1986
