Cerebral Blood Flow and Metabolism Measurement A. Hartmann, S. Hoyer, 2012-12-06 At the present time several techniques are available for studying quantitatively global and regional blood flow and metabolism of the human brain However many scientists working in the clinical and research field who would like to use these tools for their investigations may be less familiar with the indications and limitations of the individual methods The rapid development of both modern imaging techniques and new tracers may have led to some confusion in answering the question as to which method is appropriate to solve the diagnostic problem of an individual with brain disease Scepticism and ignorance as to the methods to be used as tools in differential diagnosis of brain disorders may have prevented their widespread introduction into clinical practice Thus the significance of circulatory and metabolic parameters involved in the majority of diseases of the central nervous system may have been overlooked The contributions compiled in this book describe in detail the individual techniques outline their indications and limitations and deal in particular with newer methods such as the atraumatic  $^{133}\text{Xe}$  technique stable xenon tomography three dimensional techniques such as  $^{133}\text{Xe}$  single photon emission tomography and  $^{18}\text{F}$  isopropyl P23 iodoamphetamine Positron emission tomography studies provide information on function and metabolism particularly that of oxygen and glucose in regional brain areas of interest Nuclear magnetic resonance may be a promising method for studying metabolic parameters however accurate circulation measurements can not be performed at present
