### **Perspectives on Tsunami Hazard Reduction: Observations, Theory and Planning** Gerald T.

Hebenstreit,2013-03-09 The promontory of Gargano in the southern Adriatic Sea represents one of the most interesting Italian coastal zones subjected to tsunami hazard Figure 1a gives the geographical map of Italy with a box embracing the region of Gargano details of that region are in turn sketched in Figure 1b Because of the incompleteness of the earthquake and tsunami catalogues no reports on tsunamis in this area are available prior to 1600 AD The Gargano events have been recently revised in order to establish their reliability and to attain the phenomenological reconstruction of the tsunamis Guidoboni and Tinti 1987 and 1988 Tinti et al 1995 This work fits the general purpose of assessing tsunami hazard along the Italian coasts and represents a continuation of a previous study where the first quantitative description of the 1627 tsunami from a numerical modeling viewpoint was performed Tinti and Piatanesi 1996 The earthquake took place on 30 July 1627 about mid day and was followed by four large aftershocks It claimed more than 5 000 victims and destroyed completely numerous villages in the northern Gargano area with the most severe damage located between S Severo and Lesina The earthquake excited a tsunami with the most impressive effects in proximity of the Lesina Lake where the most reliable contemporary chronicles report about an initial sea water withdrawal of about 2 miles and a subsequent penetration inland

### Risk and Uncertainty Assessment for Natural Hazards Jonathan Rougier,Lisa J. Hill,Robert Stephen John

Sparks,2013-02-21 A state of the art overview of natural hazard risk assessment for researchers and professionals in natural hazard science risk management and environmental science **An Assessment of Natural Hazards and Disasters in**

**Canada** David Etkin,C.E. Haque,Gregory R. Brooks,2003-04-30 The problems and issues of natural hazards and disasters both globally and in Canada are becoming increasingly important since the costs of extreme natural events have been escalating and significant vulnerabilities exist in Canadian society Without thoughtful and effective mitigation these costs and human suffering are likely to continue to increase An assessment of knowledge research and practice in risk hazards and disasters fields is a fundamental step towards the goal of prevention and mitigation This book on natural hazards and disasters in Canada is the first comprehensive interdisciplinary publication on this subject and is the result of a national assessment on this topic A variety of papers from the physical and social sciences explores both the risks associated with these hazards and adaptive strategies that can be used to reduce those risks Audience This excellent collection of papers is intended for academics professionals and practitioners involved in hazard reduction activities who wish to obtain a better understanding of Canadian natural hazards **Physics of Tsunamis** Boris W. Levin,Mikhail Nosov,2015-10-22 This second

edition reflects significant progress in tsunami research monitoring and mitigation within the last decade Primarily meant to summarize the state of the art knowledge on physics of tsunamis it describes up to date models of tsunamis generated by a submarine earthquake landslide volcanic eruption meteorite impact and moving atmospheric pressure inhomogeneities

Models of tsunami propagation and run up are also discussed. The book investigates methods of tsunami monitoring including coastal mareographs, deep water pressure gauges, GPS buoys, satellite altimetry, the study of ionospheric disturbances caused by tsunamis, and the study of paleotsunamis. Non-linear phenomena in tsunami source and manifestations of water compressibility are discussed in the context of their contribution to the wave amplitude and energy. The practical method of calculating the initial elevation on a water surface at a seismotectonic tsunami source is expounded. Potential and eddy traces of a tsunamigenic earthquake in the ocean are examined in terms of their applicability to tsunami warning. The first edition of this book was published in 2009. Since then a few catastrophic events occurred including the 2011 Tohoku tsunami which is well known all over the world. The book is intended for researchers, students and specialists in oceanography, geophysics, seismology, hydro-acoustics, geology and geomorphology including the engineering and insurance industries.

**Caribbean Tsunamis** K.F. O'Loughlin, James F. Lander, 2013-06-29 Caribbean Tsunamis: A 500 Year History from 1498-1998 broadly characterizes the nature of tsunamis in the Caribbean Sea while bearing in mind both scientific aspects as well as potential interest by the many governments and populations likely to be affected by the hazard. Comprehension of the nature of tsunamis and past effects is crucial for the awareness and education of populations at risk. Audience: This book provides a thorough yet highly accessible review of tsunamis in the Caribbean. It is of interest not only to tsunami and natural hazards specialists at academia and governmental institutes but also to policy makers and to the general public.

**International Compendium Of Coastal Engineering** Shinji Sato, Masahiko Isobe, 2015-04-29 The aim of this book is to provide a comprehensive overview of Coastal Engineering from basic theory to engineering practice. The authors of this book are worldwide authorities in the field. Each chapter deals with an important topic in the field of coastal engineering. The topics are of recent deep concern all over the world motivated by the 2004 Indian Ocean Tsunami, 2005 Hurricane Katrina, 2011 Tohoku Earthquake Tsunami and other natural disasters. For proper coastal zone management a broad range of knowledge is necessary. This book provides a basic understanding of the theories behind the diverse natural phenomena within the coastal areas such as waves, tsunamis and sediment transport. The book also introduces various coastal conservation technologies such as coastal structures and beach nourishment. Finally coastal zone management practices in the USA, Europe and Japan are introduced. Each chapter is self-standing and readers can begin from any topic depending on their interest.

**Tsunamis** Eddie N. Bernard, Allan R. Robinson, 2009 The world's foremost experts write about the dynamics of geophysical processes involved in tsunami generation, propagation and inundation along with the statistical and geophysical properties of tsunami recurrence and their application to tsunami forecasts and warnings.

Tsunamis, Hurricanes and Neotectonics as Driving Mechanisms in Coastal Evolution Anja Scheffers, Dieter Kelletat, 2006

Tsunamis Horace M. Karling, 2005 The phenomenon called a tsunami (soo NAH-mee) is a series of travelling ocean waves of extremely long length generated primarily by

earthquakes occurring below or near the ocean floor Underwater volcanic eruptions and landslides can also generate tsunamis In the deep ocean the tsunami waves propagate across the deep ocean with a speed exceeding 800 kilometres per hour km 500 miles per hour and a wave height of only a few tens of centimetres 1 foot or less Tsunami waves are distinguished from ordinary ocean waves by their great length between wave crests often exceeding a 100 km 60 miles or more in the deep ocean and by the time between these crests ranging from 10 minutes to an hour As they reach the shallow waters of the coast the waves slow down and the water can pile up into a wall of destruction tens of meters 30 ft or more in height The effect can be amplified where a bay harbour or lagoon funnels the wave as it moves inland Large tsunamis have been known to rise over 30 meters 100 ft Even a tsunami 3 6 meters m high can be very destructive and cause many deaths and injuries near the ocean During the 1990s over 4 000 people were killed by 10 tsunamis including more than 1000 lives lost in the 1992 Flores region Indonesia and 2200 lives in the 1998 Aitape Papua New Guinea tsunamis Property damage was nearly one billion United States US dollars Although 80 per cent of the tsunamis occur in the Pacific they can also threaten coastlines of countries in other regions including the Indian Ocean Mediterranean Sea Caribbean region and even the Atlantic Ocean
