Encyclopaedia of Mathematics, Supplement III Michiel Hazewinkel, 2007-11-23 This is the third supplementary volume to Kluwer's highly acclaimed twelve volume Encyclopaedia of Mathematics. This additional volume contains nearly 500 new entries written by experts and covers developments and topics not included in the previous volumes. These entries are arranged alphabetically throughout and a detailed index is included. This supplementary volume enhances the existing twelve volumes and together these thirteen volumes represent the most authoritative comprehensive and up to date Encyclopaedia of Mathematics available.

Lie Groups and Lie Algebras B.P. Komrakov, I.S. Krasil'shchik, G.L. Litvinov, A.B. Sossinsky, 2012-12-06 This collection contains papers conceptually related to the classical ideas of Sophus Lie i.e. to Lie groups and Lie algebras. Obviously it is impossible to embrace all such topics in a book of reasonable size. The contents of this one reflect the scientific interests of those authors whose activities to some extent at least are associated with the International Sophus Lie Center. We have divided the book into five parts in accordance with the basic topics of the papers although it can be easily seen that some of them may be attributed to several parts simultaneously. The first part quantum mathematics combines the papers related to the methods generated by the concepts of quantization and quantum group. The second part is devoted to the theory of hypergroups and Lie hypergroups which is one of the most important generalizations of the classical concept of locally compact group and of Lie group. A natural harmonic analysis arises on hypergroups while any abstract transformation of Fourier type is generated by some hypergroup commutative or not. Part III contains papers on the geometry of homogeneous spaces Lie algebras and Lie superalgebras. Classical problems of the representation theory for Lie groups as well as for topological groups and semigroups are discussed in the papers of Part IV. Finally the last part of the collection relates to applications of the ideas of Sophus Lie to differential equations.

Moufang Polygons Jacques Tits, Richard M. Weiss, 2013-03-09 Spherical buildings are certain combinatorial simplicial complexes introduced at first in the language of incidence geometries to provide a systematic geometric interpretation of the exceptional complex Lie groups. The definition of a building in terms of chamber systems and definitions of the various related notions used in this introduction such as thick residue, rank spherical etc. are given in Chapter 3.9. Via the notion of a BN pair the theory turned out to apply to simple algebraic groups over an arbitrary field. More precisely to any absolutely simple algebraic group of positive relative rank is associated a thick irreducible spherical building of the same rank these are the algebraic spherical buildings and the main result of Buildings of Spherical Type and Finite BN Pairs 101 is that the converse for 3 is almost true 1.1 Theorem. Every thick irreducible spherical building of rank at least three is classical algebraic or mixed. Classical buildings are those defined in terms of the geometry of a classical group e.g. unitary, orthogonal etc. of finite Witt index or linear of finite dimension over an arbitrary field or skew field. These are not algebraic if for instance the skew field is of infinite dimension over its center. Mixed buildings are more exotic they are related to groups which are in

some sense algebraic groups defined over a pair of fields k and K of characteristic p where $K \not\subseteq k$ and p is two or in one case three
