American Journal of Physics, 1986 Archival journal targeted toward advanced level physics and physics education with its focus on the teaching and cultural aspects of physics

Quantum Field Theory and Statistical Mechanics James Glimm, Arthur Jaffe, 1985-01-01 This volume contains a selection of expository articles on quantum field theory and statistical mechanics by James Glimm and Arthur Jaffe. They include a solution of the original interacting quantum field equations and a description of the physics which these equations contain. Quantum fields were proposed in the late 1920s as the natural framework which combines quantum theory with relativity. They have survived ever since. The mathematical description for quantum theory starts with a Hilbert space H of state vectors. Quantum fields are linear operators on this space which satisfy nonlinear wave equations of fundamental physics including coupled Dirac, Maxwell, and Yang-Mills equations. The field operators are restricted to satisfy a locality requirement that they commute or anti-commute in the case of fermions at space-like separated points. This condition is compatible with finite propagation speed and hence with special relativity. Asymptotically, these fields converge for large time to linear fields describing free particles. Using these ideas, a scattering theory had been developed based on the existence of local quantum fields.

Structural Aspects Of Quantum Field Theory (In 2 Volumes) Gerhard Grensing,2013-05-21 The book is primarily

addressed to physicists Nevertheless as numerous examples are known in which exploration of the land where physics and mathematics overlap and which quantum field theory definitely belongs to resulted in important developments in mathematics many mathematicians may also find this book interesting and even inspiring MathSciNet This book is devoted to the subject of quantum field theory It is divided into two volumes The first can serve as a textbook on the main techniques and results of quantum field theory while the second treats more recent developments in particular the subject of quantum groups and noncommutative geometry and their interrelation The first volume is directed at graduate students who want to learn the basic facts about quantum field theory It begins with a gentle introduction to classical field theory including the standard model of particle physics general relativity and also supergravity The transition to quantized fields is performed with path integral techniques by means of which the one loop renormalization of a self interacting scalar quantum field of quantum electrodynamics and the asymptotic freedom of quantum chromodynamics is treated In the last part of the first volume the application of path integral methods to systems of quantum statistical mechanics is covered The book ends with a rather detailed investigation of the fractional quantum Hall effect and gives a stringent derivation of Laughlin's trial ground state wave function as an exact ground state The second volume covers more advanced themes In particular Connes noncommutative geometry is dealt with in some considerable detail the presentation attempts to acquaint the physics community with the substantial achievements that have been reached by means of this approach towards the understanding of the elusive Higgs particle The book also covers the subject of quantum groups and its application to the fractional quantum Hall effect as it is for this paradigmatic physical system that noncommutative geometry and quantum groups can be brought together

Methods of Quantum Field Theory in Statistical Physics Aleksei Alekseevich Abrikosov, Lev Petrovich Gor'kov, I. E. Constructive Quantum Field Theory II G. Velo, A.S. Wightman, 2012-12-06 The seventh Ettore Majorana International School of Mathematical Physics was held at the Centro della Cultura Scientifica Erice Sicily 15 July 1988 The present volume collects lecture notes on the session which was entitled Constructive Quantum Field Theory II The II refers to the fact that the first such school in 1973 was devoted to the same subject The school was a NATO Advanced Study Institute sponsored by the Italian Ministry of Scientific and Technological Research and the Regional Sicilian Government At the time of the 1973 Erice School on Constructive Field Theory the speakers could summarize a decade of effort on the solution of superrenormalizable models in two dimensional space time leading to the verification of the axioms of relativistic quantum field theory for these examples The resulting lecture notes have proved to be exceptionally useful and are still in print In the decade and a half that have lapsed since that time there has been much hard work with the ultimate objective of providing a rigorous mathematical foundation for the quantum field theories in four dimensional space time that

summarize a large fraction of our current understanding of elementary particle physics QCD and the electroweak theory The lecture notes of the 1988 school record the fact that although this objective has not been reached Important progress has been made The ultraviolet stability of Yang Mills theory In four dimensions has been treated and renormalizable not superrenormalizable models in two dimensional space time Gross Neveu models have been solved

Quantum Mechanics and Quantum Field Theory Jonathan Dimock, 2011-02-03 Explaining the concepts of quantum mechanics and quantum field theory in a precise mathematical language this textbook is an ideal introduction for graduate students in mathematics helping to prepare them for further studies in quantum physics The textbook covers topics that are central to quantum physics non relativistic quantum mechanics quantum statistical mechanics relativistic quantum mechanics and quantum field theory There is also background material on analysis classical mechanics relativity and probability Each topic is explored through a statement of basic principles followed by simple examples Around 100 problems throughout the textbook help readers develop their understanding

Relativistic Quantum Field Theory, Volume 2 Michael Strickland, 2019-11-11 Volume 2 of this three part series presents the quantization of classical field theory using the path integral formalism For this volume the target audience is students who wish to learn about relativistic quantum field theory applied to particle physics however it is still very accessible and useful for students of condensed matter This volume begins with the introduction of the path integral formalism for non relativistic quantum mechanics and then using this as a basis extends the formalism to quantum fields with an infinite number of degrees of freedom Dr Strickland then discusses how to quantize gauge fields using the Fadeev Popov method and fermionic fields using Grassman algebra He then presents the path integral formulation of quantum chromodynamics and its renormalization Finally he discusses the role played by topological solutions in non abelian gauge theories
