Handbook of Universal Literature from the Best and Latest Authorities Anne Charlotte Lynch Botta, 1871 **Toronto** Jennifer McMorran, Alain Rondeau, 1999 The collection of articles in this book offers a penetrating shaft into the still burgeoning subject of light propagation and

localization in photonic crystals and disordered media While the subject has its origins in physics it has broad significance and applicability in disciplines such as engineering chemistry mathematics and medicine Unlike other branches of physics where the phenomena under consideration require extreme conditions of temperature pressure energy or isolation from competing effects the phenomena related to light localization survive under the most ordinary of conditions This provides the science described in this book with broad applicability and vitality However the greatest challenge to the further development of this field is in the reliable and inexpensive synthesis of materials of the required composition architecture and length scale where the proper balance between order and disorder is realized Similar challenges have been faced and overcome in fields such as semiconductor science and technology The challenge of photonic crystal synthesis has inspired a variety of novel fabrication protocols such as self assembly and optical interference lithography that offer much less expensive approaches than conventional semiconductor microlithography Once these challenges are fully met it is likely that light propagation and localization in photonic microstructures will be at the heart of a 21st century revolution in science and technology From the Introduction Sajeew John University of Toronto Ontario Canada One of the first books specifically focused on disorder in photonic structures *Optical Properties of Photonic Structures Interplay of Order and Disorder* explores how both order and disorder provide the key to the different regimes of light transport and to the systematic localization and trapping of light Collecting contributions from leaders of research activity in the field the book covers many important directions methods and approaches It describes various one two and three dimensional structures including opals aperiodic Fibonacci type photonic structures photonic amorphous structures photonic glasses Levy glasses and hypersonic magnetophotonic and plasmonic photonic crystals with nanocavities quantum dots and lasing action The book also addresses practical applications in areas such as optical communications optical computing laser surgery and energy
