Practical Scanning Electron Microscopy Joseph Goldstein, 2012-12-06

In the spring of 1963 a well known research institute made a market survey to assess how many scanning electron microscopes might be sold in the United States They predicted that three to five might be sold in the first year a commercial SEM was available and that ten instruments would saturate the marketplace In 1964 the Cambridge Instruments Stereoscan was introduced into the United States and in the following decade over 1200 scanning electron microscopes were sold in the U.S. alone representing an investment conservatively estimated at 50 000 100 000 each Why were the market surveyers wrong? Perhaps because they asked the wrong persons such as electron microscopists who were using the highly developed transmission electron microscopes of the day with resolutions from 5 10 Å These scientists could see little application for a microscope that was useful for looking at surfaces with a resolution of only then about 200 Å Since that time many scientists have learned to appreciate that information content in an image may be of more importance than resolution per se The SEM with its large depth of field and easily that often require little or no sample preparation interpreted images of samples tion for viewing is capable of providing significant information about rough samples at magnifications ranging from 50 X to 100 000 X This range overlaps considerably with the light microscope at the low end and with the electron microscope at the high end
