Pattern Recognition Using Neural and Functional Networks Vasantha Kalyani David, S. Rajasekaran, 2008-11-20

Biologically inspired computing is different from conventional computing. It has a different feel often the terminology does not sound like it is talking about machines. The activities of this computing sound more human than mechanistic as people speak of machines that behave, react, self-organize, learn, generalize, remember, and even to forget. Much of this technology tries to mimic nature's approach in order to mimic some of nature's capabilities. They have a rigorous mathematical basis and neural networks, for example, have a statistically valid set on which the network is trained.

Two outlines are suggested as the possible tracks for pattern recognition. They are neural networks and functional networks. Neural Networks: many interconnected elements operating in parallel carry out tasks that are not only beyond the scope of conventional processing but also cannot be understood in the same terms. Imaging applications for neural networks seem to be a natural fit. Neural networks love to do pattern recognition. A new approach to pattern recognition using microARTMAP together with wavelet transforms in the context of hand-written characters, gestures, and signatures have been dealt. The Kohonen Network, Back Propagation Networks, and Competitive Hopfield Neural Network have been considered for various applications. Functional networks being a generalized form of Neural Networks where functions are learned rather than weights is compared with Multiple Regression Analysis for some applications and the results are seen to be coincident. New kinds of intelligence can be added to machines and we will have the possibility of learning more about learning. Thus our imaginations and options are being stretched. These new machines will be fault tolerant, intelligent, and self-programming, thus trying to make the machines smarter. So as to make those who use the techniques even smarter. Chapter 1 is a brief introduction to Neural and Functional networks in the context of Pattern recognition using these disciplines. Chapter 2 gives a review of the architectures relevant to the investigation and the development of these technologies in the past few decades. Chapter 3 begins with the look at the recognition of handwritten alphabets using the algorithm for ordered list of boundary pixels as well as the Kohonen Self-Organizing Map (SOM). Chapter 4 describes the architecture of the MicroARTMAP and its capability.
