**Pattern Recognition Theory and Application** King Sun

Fu, A.B. Whinston, 1977-12-31 Research in the field of pattern recognition both in theoretical terms and in the area of application continues to flourish. Pattern recognition is a fairly diverse field involving researchers whose primary disciplines spread over at least a half dozen fields. Possibly because of the great diversity of backgrounds but a common interest in certain broad areas of application the field has grown so rapidly and yet seems to promise at least a similar growth rate for the future. This book is a collection containing some of the papers that were presented at the NATO Advanced Study Institute held in Bandol, France, September 1975. The main purpose of the institute was to present material which would provide a basic background in the field. Thus survey papers covering syntactic methods, picture processing, classification theory, and speech recognition were presented. This should have provided the listener and we hope now the reader with an acquaintance with the basic tools, a look at some of the applications, and an appraisal of how each of the particular topics will evolve. A more recent addition to the pattern recognition family is the work in the areas of economics and group choice. Since the process of recognizing and interpreting patterns is so fundamental, it is probably no surprise when a particular discipline is discovered to be amenable to the already developed techniques.

Optical Engineering, 2004 Publishes papers reporting on research and development in optical science and engineering and the practical applications of known optical science engineering and technology.

*Pattern Recognition Techniques, Technology and Applications* Danel Jaso, 2016-04-01 Pattern Recognition Techniques, Technology and Applications disclose recent advances and new ideas in promoting the techniques, technology, and applications of pattern recognition. The book provides a comprehensive overview of the developments of techniques and approaches on pattern recognition. Pattern recognition is the science of making inferences from perceptual data using tools from statistics, probability, computational geometry, machine learning, signal processing, and algorithm design. A wealth of advanced pattern recognition algorithms are emerging from the interdisciplinary between technologies of effective visual features and the human brain cognition process. Effective visual features are made possible through the rapid developments in appropriate sensor equipments, novel filter designs, and viable information processing architectures. While the understanding of human brain cognition process broadens the way in which the computer can perform pattern recognition tasks, pattern recognition is the imposition of identity on input data such as speech, images, or a stream of text by the recognition and delineation of patterns it contains and their relationships. Stages in pattern recognition may involve measurement of the object to identify, distinguishing attributes, extraction of features for the defining attributes, and comparison with known patterns to determine a match or mismatch. Pattern recognition has extensive application in astronomy, medicine, robotics, and remote sensing by satellites.
