,2005 **Machine Learning for Complex and Unmanned Systems** Jose Martinez-Carranza, Everardo Inzunza-Gonzalez, Enrique Efren Garcia-Guerrero, Esteban Tlelo-Cuautle, 2024-02-21 This book highlights applications that include machine learning methods to enhance new developments in complex and unmanned systems. The contents are organized from the applications requiring few methods to the ones combining different methods and discussing their development and hardware/software implementation. The book includes two parts: the first one collects machine learning applications in complex systems mainly discussing developments highlighting their modeling and simulation and hardware implementation. The second part collects applications of machine learning in unmanned systems including optimization and case studies in submarines, drones, and robots. The chapters discuss miscellaneous applications required by both complex and unmanned systems in the areas of artificial intelligence, cryptography, embedded hardware, electronics, the Internet of Things, and healthcare. Each chapter provides guidelines and details of different methods that can be reproduced in hardware, software, and discusses future research. Features: Provides details of applications using machine learning methods to solve real problems in engineering. Discusses new developments in the areas of complex and unmanned systems. Includes details of hardware/software implementation of machine learning methods. Includes examples of applications of different machine learning methods for future lines for research in the hot topic areas of submarines, drones, robots, cryptography, electronics, healthcare, and the Internet of Things. This book can be used by graduate students, industrial and academic professionals to examine real case studies in applying machine learning in the areas of modeling, simulation, and optimization of complex systems, cryptography, electronics, healthcare, control systems, Internet of Things, security, and unmanned systems such as submarines, drones, and robots. *The Academy*, 1890 **The Academy and Literature**, 1890 **The New York Times Theater Reviews**, 1995 *The Wall Street Journal*, 2009 Sensor-Based Human Activity Recognition for Assistive Health Technologies Muhammad Adeel Nisar, 2023-02-20 The average age of people has increased due to advances in health sciences which has led to an increase in the elderly population. This is positive news but it also raises questions about the quality of independent living for older people. Clinicians use Activities of Daily Living (ADLs) to assess older people's ability to live independently. In recent years, portable computing devices have become more present in our daily lives. Therefore, a software system that can detect ADLs based on sensor data collected from wearable devices is beneficial for detecting health problems and supporting health care. In this context, this book presents several machine learning-based approaches for human activity recognition (HAR) using time series data collected by wearable sensors in the home environment. In the first part of the book, machine learning-based approaches for atomic activity recognition are presented which are relatively simple and short-term activities. In the second part, the algorithms for detecting long-term and complex ADLs are presented. In this part, a two-stage recognition framework is also presented as well as an online recognition system for continuous monitoring of HAR. In the third and final part, a novel approach is proposed that not only solves the problem of data scarcity but also

improves the performance of HAR by implementing multitask learning based methods The proposed approach simultaneously trains the models of short and long term activities regardless of their temporal scale The results show that the proposed approach improves classification performance compared to single task learning Contemporary Developments in Agricultural Cyber-Physical Systems Karthick, G.S.,2023-08-01 The cultivation of crops plays a very important role in agriculture However proper maintenance and management are required Lack of such management would lead to crop loss or reduced crop yields Hence the ability to detect and identify diseases on infected crops is a problem of increasing concern Real time disease detection systems do not exist in the current agricultural landscape It requires tremendous amounts of work expertise in plant diseases and excessive processing time Using precision agriculture techniques combined with AI a great deal of work is reduced Contemporary Developments in Agricultural Cyber Physical Systems provides a forum for researchers and practitioners to exchange ideas and achieve progress in cyber physical systems by highlighting agricultural applications advances and research challenges The book features chapters on all aspects pertaining to this multidisciplinary paradigm in particular in its application to sustainable agriculture developments Covering topics such as automation monitoring systems and smart agriculture this premier reference source is an excellent resource for scientists healthcare professionals data analysts computer scientists students and educators of higher education researchers and academicians
