## ABSTRACT

Luttinger liquid (LL) is a canonical non-Fermi liquid model describing interacting fermions in 1D. While its applicability has been verified in several (quasi-)1D materials, the theoretical generalization to understand the non-Fermi liquid physics in higher dimensions remains unconfirmed experimentally. Here we investigate electronic structure of two molybdenum oxides, quasi-1D  $\text{Rb}_x\text{MoO}_3$  (RMO) and quasi-2D  $\text{y-Mo}_2\text{O}_3$  (MO) combining angle-resolved photoemission spectroscopy (ARPES) and ab initio calculation. The ARPES spectra in both materials show suppressed spectral weight near the Fermi energy, excellently described by the LL model. Specifically, the quasi-2D MO resembles the geometry of crossed sliding LL model, where the orthogonal orbital texture protects the woven-chain structure and thus realize a 2D LL.

## INTRODUCTION

1D differs radically from 2D and 3D. For example, the phase space of low-energy excitations is reduced significantly. Moreover, the Landau quasi-particle scenario is invalidated due to the perfectly-nesting Fermi surface in 1D. As a result, LL model is generally adopted in 1D to replace the Fermi liquid concept used in higher dimensions.

A prominent feature of LL is the quantum criticality; its correlation function exhibits power-law behavior. For example, the density of states shows power-law relation with both energy and temperature.

Although stable only in 1D by construction, the concept of LL is also proposed to be relevant to many mysteries including the normal state of cuprate superconductor and unconventional metal. Accordingly, a 2D LL is proposed theoretically by weaving 1D chains into networks, yet unconfirmed experimentally.

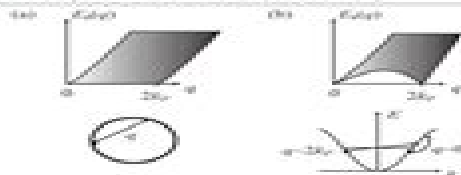

Fig. 1 | Particle-hole excitation spectrum in 2/3D (a) and 1D (b). In 1D, the low-energy excitation has limited phase space and a well-defined dispersion for small momentum.

## METHODS

ARPES is a technique for measuring electronic structure of materials by resolving the energy and momentum of the electrons excited by the incident light.

Fig. 2 | Principles of ARPES. The electronic structure of the sample can be deduced by the energy and momentum of the electrons accepted by the analyzer.

## RESULTS

### I. Crystal and electronic structure of quasi-1D RMO

- The crystal structure of RMO is made of quasi-1D slabs of Mo-O octahedrons.
- The Fermi surface of RMO consists of ribbon-like nearly-parallel sheets.

Fig. 3 | Crystal structure (a) and experimental Fermi surface (b) of RMO, showing quasi-1D nature of the material.

### II. Quasi-1D Luttinger liquid in RMO

- The intensity of ARPES spectra at different temperatures can be fitted with the LL spectral function, proving the power-law with energy (the singularity at the Fermi energy is smeared out by the finite temperature).
- The ARPES spectra can also be scaled to a single curve, i.e.,  $I(E) = (E - E_F) / k_B T$ ,  $T/T^*$  is independent of temperature, proving the power-law with temperature.

Fig. 4 | Experimental evidences of LL physics in RMO, demonstrated both by fitting ARPES intensity with LL model (a) and energy-temperature scaling (b).

### III. Crystal and electronic structure of quasi-2D MO

- The crystal structure of MO is made of quasi-2D slabs of Mo-O octahedrons and tetrahedrons. The slab can be regarded as woven quasi-1D chains running along three different directions.
- The Fermi surface of MO consists of chain-like sheets along three different directions with only weak hybridization with each other, corresponding to the hidden 1D chains in the crystal structure.

## CONCLUSION

Combining ARPES and ab initio calculation, we reveal typical quasi-1D LL in RMO and novel 2D LL in MO. These results point to rich LL physics in molybdenum oxides (more results will be presented in our later publications) and extend the understanding of LL and other non-Fermi liquid systems.

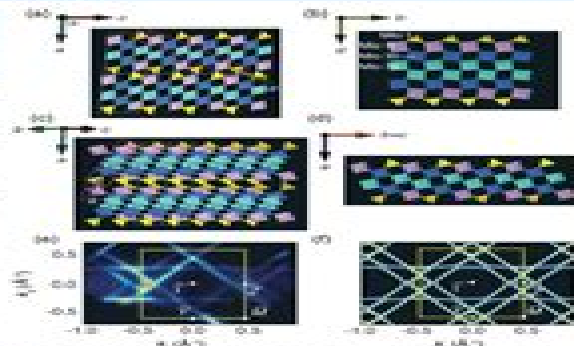

Fig. 5 | (a, b) and (c, d) show hidden quasi-1D chains along crystalline b- and b-c (or equivalently b-c) directions, respectively. (e) and (f) show the experimental (e) and ab initio-calculated (f) Fermi surface.

### IV. 2D Luttinger liquid in MO

- Similar to those of RMO, the ARPES spectra of MO can both be fitted with the LL model and scaled to a single curve, proving the power-law with both energy and temperature.
- However, MO is quasi-2D, so ARPES measurement can be carried out along different directions. The experimental data show that the LL exponent is independent of the measuring direction.
- The calculation reveals the link between the hidden chains and the orbital components. Thus MO realizes 2D LL preserved by the orthogonal orbitals.

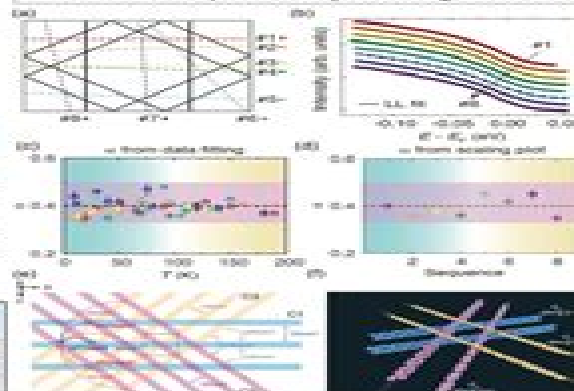

Fig. 6 | Data in (b) is measured along lines in (a). (c, d) show LL exponent extracted from fitting and scaling exhibiting isotropy. (e) Hopping integral in MO. (f) 2D LL in MO.
