 Englishman named Charles Babbage designed and partly built a calculating machine originally intended for use in deriving
 and printing logarithmic and other tables used in the shipping industry At that time such tables were often inaccurate copied
 carelessly and had been instrumental in causing a number of maritime disasters Babbage s machine called a Difference
 Engine because it performed its cal culations using the principle of partial differences was intended to substantially reduce
 the number of errors made by humans calculating the tables Babbage had also designed but never built a forerunner of the
 modern printer which would also reduce the number of errors admitted during the transcription of the results Nowadays a
 system implemented to perform the function of Babbage s engine would be classed as safety critical That is the failure of the
 system to produce correct results could result in the loss of human life mass destruction of property in the form of ships and
 cargo as well as financial losses and loss of competitive advantage for the shipping firm Research and Development in
