

## CANCER GENETICS

Normally, human body cells are programmed to develop, grow, differentiate & die in response to a complex system of biochemical signals, but if a clone of cells freed of these developmental programming constraints and capable of inappropriate proliferation it will lead to produce a cancer! so we can define cancer as is a collection of genetic disorders that share the common feature of uncontrolled cell growth. This leads to a mass of cells termed a neoplasm (Greek, "new formation"), or tumor (1).

**As the cancer is genetic disorder, there should be a responsible genes for it.**

**1<sup>st</sup>** we have to know the regulation of cell growth which is accomplished by substances that include:

- (1) growth factors that transmit signals from one cell to another.
- (2) specific receptors for the growth factors.
- (3) signal transduction molecules that activate a cascade of phosphorylating reactions within the cell.
