

Power Aware Computing

- The concept of power aware computing is to save energy without losing performance.
- It is the primary focus of designers of portable and battery-powered computing systems.
- Better management of power translates into longer battery life or into smaller batteries, which in turn implies smaller and lighter devices.
- The three areas of power aware computing that we will focus on: power aware routing, power aware cache management and power aware microarchitecture.

Power Aware Computing:

Power Aware Computing Robert Graybill, Rami Melhem, 2013-04-17 With the advent of portable and autonomous computing systems power consumption has emerged as a focal point in many research projects commercial systems and DoD platforms One current research initiative which drew much attention to this area is the Power Aware Computing and Communications PAC C program sponsored by DARPA Many of the chapters in this book include results from work that have been supported by the PACIC program The performance of computer systems has been tremendously improving while the size and weight of such systems has been constantly shrinking The capacities of batteries relative to their sizes and weights has been also improving but at a rate which is much slower than the rate of improvement in computer performance and the rate of shrinking in computer sizes The relation between the power consumption of a computer system and its performance and size is a complex one which is very much dependent on the specific system and the technology used to build that system We do not need a complex argument however to be convinced that energy and power which is the rate of energy consumption are becoming critical components in computer systems in general and portable and autonomous systems in particular Most of the early research on power consumption in computer systems addressed the issue of minimizing power in a given platform which usually translates into minimizing energy consumption and thus longer battery life

GPU and its components has become crucial for hardware and software system design. Here we describe our technique for a coordinated measurement approach that combines real total power measurement and per component power estimation. To identify power consumption accurately we introduce the Activity based Model for GPUs (AMG) from which we identify activity factors and power for microarchitectures on GPUs that will help in analyzing power tradeoffs of one component versus another using microbenchmarks. The key challenge addressed in this thesis is real time power consumption which can be accurately estimated using NVIDIA's Management Library (NVML) through Pthreads. We validated our model using Kill A Watt power meter and the results are accurate within 10%. The resulting Performance Application Programming Interface (PAPI) NVML component offers real time total power measurements for GPUs. This thesis also compares a single NVIDIA C2075 GPU running MAGMA Matrix Algebra on GPU and Multicore Architectures kernels to a 48 core AMD Istanbul CPU running LAPACK.

Moreover, the higher power energy dissipation has significantly reduced battery life in portable systems. While system designers have traditionally relied on circuit level techniques to reduce power energy there is a growing need to address power energy dissipation at all levels of the computer system. We are pleased to welcome you to the proceedings of the Power Aware Computer Systems (PACS) 2000 workshop. PACS 2000 was the first workshop in its series and its aim was to bring together experts from academia and industry to address power energy awareness at all levels of computer systems. In these proceedings we bring you several excellent research contributions spanning a wide spectrum of areas in power aware systems from application all the way to compilers and microarchitecture and to power performance estimating models and tools. We have grouped the contributions into the following specific categories: 1. power aware microarchitectural circuit techniques, 2. application compiler power optimizations, 3. exploiting opportunity for power optimization in instruction scheduling and cache memories and 4. power performance models and tools.
