## Seven Towers:

Validation of a Surface-layer Windflow Model Using Climatology and Meteorological Tower Data from Vandenberg AFB, California John M. Lanicci, 1986 This report describes the 2nd phase of a study involving a surface layer windflow model The model produces a two dimensional x y plane variational analysis of windflow by employing Gauss principle of least constraints to adjust an initial windfield to effects of topography stability momentum advection and mass conservation It used detailed terrain data 100 to 200 m horizontal resolution to compensate for sparse meteorological data available over the small areas for which the model is run 25 to 250 sq km The first phase involved testing of the model to effects of stability and vegetation using terrain vegetation and climate for Ft Polk LA The 2nd phase involves further model development including changes in meteorological data input as well as changes in wind and stability initializations Model experiments using artificially produced terrain were conducted to test these changes A two part model validation was then performed using climate data and archived meteorological tower data from Vandenberg AFB California The area of interest is 11 x 12 km and covers the South Vandenberg Launch Complex
