Passive Energy Dissipation Systems In Structural Engineering:

Passive Energy Dissipation Systems in Structural Engineering T. T. Soong, G. F. Dargush, 1997-05-05 One of the principal challenges in structural engineering concerns the development of innovative design concepts to better protect structures together with their occupants and contents from the damaging effects of destructive environmental forces including those due to winds waves and earthquakes Passive energy dissipation devices when incorporated into a structure absorb or consume a portion of the input energy thereby reducing energy dissipation demand on primary structural members and minimizing possible structural damage This book is a unified treatment of passive energy dissipation systems Basic principles mathematical modeling practical considerations implementation issues and structural applications are discussed for each major device type Numerous examples and case studies are included

Passive Energy Dissipation Systems for Structural Design and Retrofit Michalakis C. Constantinou, T. T. Soong, Gary F. Dargush, 1998 Recent Advances in the Design of Structures with Passive Energy Dissipation Systems Giuseppe Ricciardi, Dario De Domenico, Ruifu

Zhang, 2020-06-23 Passive vibration control plays a crucial role in structural engineering Common solutions include seismic isolation and damping systems with various kinds of devices such as viscous viscoelastic hysteretic and friction dampers These strategies have been widely utilized in engineering practice and their efficacy has been demonstrated in mitigating damage and preventing the collapse of buildings bridges and industrial facilities However there is a need for more sophisticated analytical and numerical tools to design structures equipped with optimally configured devices On the other hand the family of devices and dissipative elements used for structural protection keeps evolving because of growing performance demands and new progress achieved in materials science and mechanical engineering This Special Issue collects 13 contributions related to the development and application of passive vibration control strategies for structures covering both traditional and innovative devices In particular the contributions concern experimental and theoretical investigations of high efficiency dampers and isolation bearings optimization of conventional and innovative energy dissipation devices performance based and probability based design of damped structures application of nonlinear dynamics random vibration theory and modern control theory to the design of structures with passive energy dissipation systems and critical discussion of implemented isolation damping technologies in significant or emblematic engineering projects
