

Concrete Quality Control

The Untapped Profit Center

By Don Bain and Karthik Obla

It has been said that quality control (QC) does not matter once the project specifications have been satisfied. QC has been treated as a cost center, with not much thought as to how it can benefit the bottom line of the ready mixed concrete company. For some, QC is endless comparative testing with a testing laboratory to evaluate the quality of testing, while for some others it is to add extra cement to minimize their risk. It is the authors' view that concrete QC, if properly approached, can be a tangible profit center for the company. Many companies are already practicing good QC and are prospering as a result.

What is QC?

A QC program is much more effective if rather than trying to catch the defective loads that might be produced, it endeavors to ensure that no defective loads are in fact produced.¹

Concrete is a variable product. Each and every day, the product is slightly different. The main thrust of any good QC system is to attempt to control and minimize this variability. A lower variability will result in a lower standard deviation (σ) and a reduced target average strength (f'_{cr}) for a specified strength (f'_c). ACI 318-05²

requires that the target average strength should be the maximum of the following two equations:

$$f'_{cr} = f'_c + 1,34\sigma$$

$$f'_{cr} = f'_c + 2,33\sigma - 500$$

Table 1, which is a reproduction of Table 3.2 from ACI 214R-02,³ shows that the standards of concrete control for general construction testing can vary from excellent ($\sigma < 400$ psi) to poor ($\sigma > 700$ psi). This applies to typical concrete strengths in the range of 3,000 to 5,000 psi.

Table 2 shows the cost savings due to
