*Embedded Multiprocessors* Sundararajan Sriram,Shuvra S. Bhattacharyya,2018-10-03 Techniques for Optimizing Multiprocessor Implementations of Signal Processing Applications An indispensable component of the information age signal processing is embedded in a variety of consumer devices including cell phones and digital television as well as in communication infrastructure such as media servers and cellular base stations Multiple programmable processors along with custom hardware running in parallel are needed to achieve the computation throughput required of such applications Reviews important research in key areas related to the multiprocessor implementation of multimedia systemsEmbedded Multiprocessors Scheduling and Synchronization Second Edition presents architectures and design methodologies for parallel systems in embedded digital signal processing DSP applications It discusses application modeling techniques for multimedia systems the incorporation of interprocessor communication costs into multiprocessor scheduling decisions and a modeling methodology the synchronization graph for multiprocessor system performance analysis The book also applies the synchronization graph model to develop hardware and software optimizations that can significantly reduce the interprocessor communication overhead of a given schedule Chronicles recent activity dealing with single chip multiprocessors and dataflow modelsThis edition updates the background material on existing embedded multiprocessors including single chip multiprocessors It also summarizes the new research on dataflow models for signal processing that has been carried out since the publication of the first edition Harness the power of multiprocessorsThis book explores the optimization of interprocessor communication and

synchronization in embedded multiprocessor systems It shows you how to design multiprocessor computer systems that are streamlined for multimedia applications      **Algorithms and Parallel VLSI Architectures III** M. Moonen,F.

Catthoor,1995-03-16 A comprehensive overview of the current evolution of research in algorithms architectures and compilation for parallel systems is provided by this publication The contributions focus specifically on domains where embedded systems are required either oriented to application specific or to programmable realisations These are crucial in domains such as audio telecom instrumentation speech robotics medical and automotive processing image and video processing TV multimedia radar and sonar The book will be of particular interest to the academic community because of the detailed descriptions of research results presented In addition many contributions feature the real life applications that are responsible for driving research and the impact of their specific characteristics on the methodologies is assessed The publication will also be of considerable value to senior design engineers and CAD managers in the industrial arena who wish either to anticipate the evolution of commercially available design tools or to utilize the presented concepts in their own R D programmes      Memory Management for Synthesis of DSP Software Praveen K. Murthy,Shuvra S.

Bhattacharyya,2018-12-14 Although programming in memory restricted environments is never easy this holds especially true for digital signal processing DSP The data rich computation intensive nature of DSP makes memory management a chief and challenging concern for designers Memory Management for Synthesis of DSP Software focuses on minimizing memory requirements during the synthesis of DSP software from dataflow representations Dataflow representations are used in many popular DSP design tools and the methods of this book can be applied in that context as well as other contexts where dataflow is used This book systematically reviews research conducted by the authors on memory minimization techniques for compiling synchronous dataflow SDF specifications Beginning with an overview of the foundations of software synthesis techniques from SDF descriptions it examines aggressive buffer sharing techniques that take advantage of specific and quantifiable tradeoffs between code size and buffer size to achieve high levels of buffer memory optimization The authors outline coarse level strategies using lifetime analysis and dynamic storage allocation DSA for efficient buffer sharing as one approach and demonstrate the role of the CBP consumed before produced parameter at a finer level using a merging framework for buffer sharing They present two powerful algorithms for combining these sharing techniques and then introduce techniques that are not restricted to the single appearance scheduling space of the other techniques Extensively illustrated to clarify the mathematical concepts Memory Management for Synthesis of DSP Software presents a comprehensive survey of state of the art research in DSP software synthesis      **Software Synthesis from Dataflow**

**Graphs** Shuvra S. Bhattacharyya,Praveen K. Murthy,Edward A. Lee,2012-12-06 Software Synthesis from Dataflow Graphs addresses the problem of generating efficient software implementations from applications specified as synchronous dataflow graphs for programmable digital signal processors DSPs used in embedded real time systems The advent of high speed

graphics workstations has made feasible the use of graphical block diagram programming environments by designers of signal processing systems A particular subset of dataflow called Synchronous Dataflow SDF has proven efficient for representing a wide class of unirate and multirate signal processing algorithms and has been used as the basis for numerous DSP block diagram based programming environments such as the Signal Processing Workstation from Cadence Design Systems Inc COSSAP from Synopsys both commercial tools and the Ptolemy environment from the University of California at Berkeley A key property of the SDF model is that static schedules can be determined at compile time This removes the overhead of dynamic scheduling and is thus useful for real time DSP programs where throughput requirements are often severe Another constraint that programmable DSPs for embedded systems have is the limited amount of on chip memory Off chip memory is not only expensive but is also slower and increases the power consumption of the system hence it is imperative that programs fit in the on chip memory whenever possible Software Synthesis from Dataflow Graphs reviews the state of the art in constructing static memory optimal schedules for programs expressed as SDF graphs Code size reduction is obtained by the careful organization of loops in the target code Data buffering is optimized by constructing the loop hierarchy in provably optimal ways for many classes of SDF graphs The central result is a uniprocessor scheduling framework that provably synthesizes the most compact looping structures called singleappearance schedules for a certain class of SDF graphs In addition algorithms and heuristics are presented that generate single appearance schedules optimized for data buffering usage Numerous practical examples and extensive experimental data are provided to illustrate the efficacy of these techniques
