SYSTEMS ANALYSIS AND DESIGN

4) Define stereotype, tagged value and constraint.

Stereotypes:-

The UML provides a language for structural things, behavioral things, grouping things, and notational things. these four basic kinds of things address the overwhelming majority of the systems we will need to model. However, sometimes we'll want to introduce new things that speak the vocabulary of the domain and look like primitive building blocks.

A stereotype is not the same as a parent class in a parent/child generalization relationship. Rather, we can think of a stereotype as a metatype, because each one creates the equivalent of a new class in the UML's metamodel. For ex, if we are modeling a business process, we'll want to introduce things like workers, documents, and policies. Similarly, if we are following a development process, such as the Rational Unified Process, we'll want to model using boundary, control, and entity classes. This is where the real value of stereotypes comes in. When we stereotype an element such as node or a class, we are in effect extending the UML by creating a new building block just like an existing one but with its own special properties (each stereotype may provide its own set of tagged values), semantics (each stereotype may provide its own constraints), and notation (each stereotype may provide its own icon).

In its simplest form, a stereotype is rendered as a name enclosed by guillemots (for ex, "name") and placed above the name of another element. As visual cue, we may define an icon for the stereotype and render that icon to the right of the name (if we are using
