Simulation Model future Analysis:

Reachable Futures, Structural Change, and the Practical Credibility of Environmental Simulation Models

Olufemi O. Osidele, 2002-03 Simulation modeling is arguably the most versatile scientific tool for predicting the future environment. However, the reliability of model-based predictions is limited to the behavior domain defined by the historical data employed for conceptualizing and calibrating the model. Future changes in external inputs and internal structure tend to produce system behavior significantly different from prior predictions. To abate this seeming lack of credibility, it is now customary to qualify model predictions with uncertainty estimates. This dissertation explores the complementary approach of back-casting future scenarios. Centered on the analysis of uncertainty, a methodological framework is developed for the computational evaluation of environmental futures driven by stakeholder participation as a means for establishing credibility in the model. The analysis reveals possible structural change between the observed past and speculated future scenarios by comparing the ranking of key sources of uncertainty in model outputs. Three sampling-based methods are employed: Regionalized Sensitivity Analysis (RSA), Tree Structured Density Estimation (TSDE), and Uniform Covering by Probabilistic Rejection (UCPR). RSA and TSDE are tested for identifying and ranking the key factors that influence ecological behavior in Lake Oglethorpe, Georgia, and UCPR for recovering parameters of a rainfall runoff model of an experimental watershed near Loch Ard, Scotland. The framework is applied to an integrated assessment of ecological behavior in Lake Lanier, Georgia. Stakeholders' fears and desires for the future state of the reservoir are elicited and encoded for analysis. The results indicate: i) that the desired future is more reachable and accompanied by more significant structural change than the feared future, and ii) that sediment, water, nutrient interactions, secondary production, and microbial processes play a critical role in the future ecological behavior of the reservoir. Thus, it is possible to: i) confirm or refute stakeholder concerns for the future environment, ii) inform priorities for future environmental policy actions, iii) identify critical gaps in current knowledge in order to prioritize future scientific research, and iv) promote adaptive community learning through the continual mutual feedback between scenario generation and systematic analysis. By bridging the gap between stakeholder imagination and scientific theory through computational analysis, the framework provides a promising direction for integrated environmental assessment.

Shaping Tomorrow's World Elke Seefried, 2024-05-01 *Shaping Tomorrow's World* tells the crucial story of how futures studies developed in West Germany, Europe, the US, and within global futures networks from the 1940s to the 1980s. It charts the emergence of different approaches and thought styles within the field, ranging from Cold War defense intellectuals such as Herman Kahn to critical peace activists like Robert Jungk. Engaging with the challenges of the looming nuclear war, the changing phases of the Cold War, 1968, and the growing importance of both the Global South and environmentalism, this book argues that futures scholars actively contributed to these processes of change. This multiple award-winning study combines national and transnational perspectives to present a unique history of envisioning, forecasting, and shaping the future.

Computer Systems Performance Evaluation and Prediction Paul Fortier, Howard Michel, 2003-07-09 Computer Systems Performance Evaluation and Prediction bridges the gap from academic to professional analysis of computer performance. This book makes analytic simulation and instrumentation based modeling and performance evaluation of computer systems components understandable to a wide audience of computer systems designers, developers, administrators, managers, and users. The book assumes familiarity with computer systems architecture, computer systems software, computer networks, and mathematics including calculus and linear algebra. Fills the void between engineering practice and the academic domain's treatment of computer systems performance evaluation and assessment. Provides a single source where the professional or student can learn how to perform computer systems engineering tradeoff analysis. Allows managers to realize cost effective yet optimal computer systems tuned to a specific application.

Energy Policy Modeling in the 21st Century Hassan Qudrat-Ullah, 2013-10-04 The roles and applications of various modeling approaches aimed at improving the usefulness of energy policy models in public decision making are covered by this book. The development, validation, and applications of system dynamics and agent based models in service of energy policy design and assessment in the 21st century is a key focus. A number of modeling approaches and models for energy policy with a particular focus on low carbon economic development of regions and states are covered. Chapters on system dynamics methodology, model based theory, fuzzy system dynamics framework, and optimization modeling approach are presented along with several chapters on future research opportunities for the energy policy modeling community. The use of model based analysis and scenarios in energy policy design and assessment has seen phenomenal growth during the past several decades. In recent years, renewed concerns about climate change and energy security have posed unique modeling challenges. By utilizing the validation techniques and procedures which are effectively demonstrated in these contributions, researchers and practitioners in energy systems domain can increase the appeal and acceptance of their policy models.

Learning and Applying Landscape Ecology Vinayak Joshipura, 2025-02-20 Learning and Applying Landscape Ecology serves as a comprehensive guide to the interdisciplinary field of landscape ecology. Authored by leading experts, we provide an overview of key concepts, theories, methods, and applications relevant to understanding and managing landscapes. We start by introducing the fundamental principles of landscape ecology, including spatial patterns, landscape structure, and ecological processes. Our book explores dynamic interactions between natural and human systems, emphasizing the importance of considering multiple scales, spatial heterogeneity, and landscape connectivity in ecological studies. Topics such as landscape dynamics, fragmentation, resilience, and sustainability are thoroughly covered. We highlight the role of landscape ecology in addressing pressing environmental challenges like habitat loss, biodiversity conservation, climate change, and land use planning. Drawing insights from ecology, geography, sociology, economics, and other fields, our interdisciplinary approach emphasizes the interconnectedness between human societies and the environment. Numerous case studies, examples, and practical applications illustrate key concepts and

methods providing insights into real world landscape management challenges Learning and Applying Landscape Ecology is suitable for students researchers practitioners and policymakers It serves as a valuable resource for courses in ecology environmental science geography planning and related disciplines offering a comprehensive foundation for exploring landscape dynamics and sustainability
