

Random mappings

- Let F_n denote all functions (mappings) from a finite domain of size n to a finite co-domain of size n
- Every mapping is equally likely to be chosen, $|F_n| = n^n$ the probability of choosing a particular mapping is $1/n^n$
- Example. $f : \{1, 2, \dots, 13\} \rightarrow \{1, 2, \dots, 13\}$

Graphic by Maithili Narasimha

- As n tends to infinity, the following are expectations of some parameters associated with a random point in $\{1, 2, \dots, n\}$ and a random function from F_n : (i) tail length: $\sqrt{(\pi n/8)}$ (ii) cycle length: $\sqrt{(\pi n/8)}$ (iii) rho-length: $\sqrt{(\pi n/2)}$.

Kolčín,1986 *Fast Software Encryption* Bart Preneel,1995-10-25 This book contains a set of revised refereed papers selected from the presentations at the Second International Workshop on Fast Software Encryption held in Leuven Belgium in December 1994 The 28 papers presented significantly advance the state of the art of software algorithms for two cryptographic primitives requiring very high speeds namely encryption algorithms and hash functions this volume contains six proposals for new ciphers as well as new results on the security of the new proposals In addition there is an introductory overview by the volume editor The papers are organized in several sections on stream ciphers and block ciphers other papers deal with new algorithms and protocols or other recent results Random Mappings V. directions In this manuscript we introduce measurable expanding random dynamical systems develop the thermodynamical formalism and establish in particular the exponential decay of correlations and analyticity of the expected pressure although the spectral gap property does not hold This theory is then used to investigate fractal properties of conformal random systems We prove a Bowen's formula and develop the multifractal formalism of the Gibbs states Depending on the behavior of the Birkhoff sums of the pressure function we arrive at a natural classification of the systems into two classes quasi deterministic systems which share many properties of deterministic ones and essentially random systems which are rather generic and never bi Lipschitz equivalent to deterministic systems We show that in the essentially random case the Hausdorff measure vanishes which refutes a conjecture by Bogenschutz and Ochs Lastly we present applications of our results to various specific conformal random systems and positively answer a question posed by Bruck and Buger concerning the Hausdorff dimension of quadratic random Julia sets
