Quantitative Analysis of Movement Peter Turchin, 1998-01-01 In the last two decades it has become increasingly clear that the spatial dimension is a critically important aspect of ecological dynamics Ecologists are currently investing an enormous amount of effort in quantifying movement patterns of organisms Connecting these data to general issues in metapopulation biology and landscape ecology as well as to applied questions in conservation and natural resource management however has proved to be a non trivial task This book presents a systematic exposition of quantitative methods for analyzing and modeling movements of organisms in the field Quantitative Analysis of Movement is intended for graduate students and researchers interested in spatial ecology including applications to conservation pest control and fisheries Models are a key ingredient in the analytical approaches developed in the book however the primary focus is not on mathematical methods but on connections between models and data The methodological approaches discussed in the book will be useful to ecologists working with all taxonomic groups Case studies have been selected from a wide variety of organisms including plants seed dispersal spatial spread of clonal plants insects and vertebrates primarily fish birds and mammals *Quantitative Analysis of Movement* ,1998 **Quantitative Analysis of Movement** ,1998 **Qualitative**

Sensory Guidance of Movement
Chairman Mitchell Glickstein 1998

In the past few years there has been an increasing recognition of the multiplicity of sensory and motor areas of the cerebral cortex. However, still relatively little is known about the way in which sensory areas are functionally linked to motor areas. On the basis of current anatomical evidence, there are three major pathways involved in this linking. One of these routes is by way of cortico-cortical links beginning in the primary sensory areas of the cortex and connecting via a series of synaptic relays to motor or premotor areas. There are also two massive subcortical routes. One of these involves the basal ganglia, the other the cerebellum. This book focuses on current research on the structure and functions of these three pathways and their role in the sensory guidance of movement. Motor psychophysicists have made progress in characterizing the nature of movements such as reaching and grasping and how such movements are modified by incoming sensory information. Anatomical studies have revealed important new information about the ways in which sensory information is relayed to the basal ganglia and cerebellum. There is now a volume of scanning evidence about the activity of brain areas in humans and recordings from individual neurons in animals during sensory-guided movement. This book summarizes much of this recent knowledge and provides a forum for suggesting new avenues for further study. The topics covered also have important implications for understanding the role of these pathways in human disease.
