Optimization Modelling Ruhul Amin Sarker, Charles S. Newton, 2007-10-15 Although a useful and important tool the potential of mathematical modelling for decision making is often neglected Considered an art by many and weird science by some modelling is not as widely appreciated in problem solving and decision making as perhaps it should be And although many operations research management science and optimization **Computerworld**, 1993-12-27 For more than 40 years Computerworld has been the leading source of technology news and information for IT influencers worldwide Computerworld s award winning Web site Computerworld com twice monthly publication focused conference series and custom research form the hub of the world s largest global IT media network *Multicriterion Analysis in Engineering and Management* D. Nagesh Kumar, 2010 This book concentrates on the basic principles of multicriterion analysis and acquaints the reader with the recent trends in MCDM analysis It explains the basics of Structured Decision Making SDM and describes the various features of traditional optimization methods such as linear and non linear programming and dynamic programming as well as non traditional optimization methods such as genetic algorithms differential evolution and simulated annealing and quenching The text elaborates the normalization methods weight estimation methods and multiobjective optimization methods both in traditional and non traditional environments Classification approaches with cluster validation indices discrete MCDM methods both in deterministic and fuzzy approach and group decision making methods are discussed in detail Advanced topics in decision making such as data envelopment analysis Taguchi methodology ant colony optimization and particle swarm optimization are also covered In addition the book includes many case studies for better comprehension of the procedures involved in the methods **Parameterized Verification of Synchronized Concurrent Programs** Zeinab Ganjei, 2021-03-19 There is currently an increasing demand for concurrent programs Checking the correctness of concurrent programs is a complex task due to the interleavings of processes Sometimes violation of the correctness properties in such systems causes human or resource losses therefore it is crucial to check the correctness of such systems Two main approaches to software analysis are testing and formal verification Testing can help discover many bugs at a low cost However it cannot prove the correctness of a program Formal verification on the other hand is the approach for proving program correctness Model checking is a formal verification technique that is suitable for concurrent programs It aims to automatically establish the correctness expressed in terms of temporal properties of a program through an exhaustive search of the behavior of the system Model checking was initially introduced for the purpose of verifying finite state concurrent programs and extending it to infinite state systems is an active research area In this thesis we focus on the formal verification of parameterized systems That is systems in which the number of executing processes is not bounded a priori We provide fully automatic and parameterized model checking techniques for establishing the correctness of safety properties for certain classes of concurrent programs We provide an open source prototype for every technique and present our

experimental results on several benchmarks First we address the problem of automatically checking safety properties for bounded as well as parameterized phaser programs Phaser programs are concurrent programs that make use of the complex synchronization construct of Habanero Java phasers For the bounded case we establish the decidability of checking the violation of program assertions and the undecidability of checking deadlock freedom For the parameterized case we study different formulations of the verification problem and propose an exact procedure that is guaranteed to terminate for some reachability problems even in the presence of unbounded phases and arbitrarily many spawned processes Second we propose an approach for automatic verification of parameterized concurrent programs in which shared variables are manipulated by atomic transitions to count and synchronize the spawned processes For this purpose we introduce counting predicates that related counters that refer to the number of processes satisfying some given properties to the variables that are directly manipulated by the concurrent processes We then combine existing works on the counter predicate and constrained monotonic abstraction and build a nested counterexample based refinement scheme to establish correctness Third we introduce Lazy Constrained Monotonic Abstraction for more efficient exploration of well structured abstractions of infinite state non monotonic systems We propose several heuristics and assess the efficiency of the proposed technique by extensive experiments using our open source prototype Lastly we propose a sound but in general incomplete procedure for automatic verification of safety properties for a class of fault tolerant distributed protocols described in the Heard Of HO for short model The HO model is a popular model for describing distributed protocols We propose a verification procedure that is guaranteed to terminate even for unbounded number of the processes that execute the distributed protocol **QSB+**
