Abstract

The participation of the preoptic-post neurohypophyseal neurosecretory system in fish breeding was shown by histomorphological, immunohistochemical and electronic microscopical researches. The activation of discharge of nonapeptide neurohormones into blood circulation from posterior neurohypophysis at the beginning of spawning, with the following decrease of functional activity of system after it are revealed in every lumpsum (simultaneous) spawning fishes independently of its season (for example: *Acipenser*, *Lota*, *Oncorhynchus*). The similar reaction of neurosecretory system is observed morphologically also under the conditions of experimental stress—the containing of the adult acipenseridae fish in hypertonic medium. The diphasic reaction of neurosecretory system conforming to stages of an alarm and a resistance of stress, is considered to be the reflection of participation of neurosecretory system in protective-adaptive reactions of an organism to a physiological stress arising at breeding period of lumpsum spawning polycyclic fishes. At monocyclic species at once after spawning there becomes the blockage of function of releasing of neurohormones from posterior neurohypophysis corresponding to supernatural inhibition of system at distress. The functional role of nonapeptide neurohormones in breeding and the possibility of constructive usage of representation about the spawning as a physiological stress are discussed on the basis of analysis of morpho-functional mechanisms of participation of neurosecretory system in this process.

Keywords: sturgeon and salmon fish, migration and spawning, neuroendocrine regulation of fish reproduction, hypothalamic-pituitary neurosecretory system of fish.

Introduction

By means of ecologo-histophysiological and experimental researches executed by the pathway of a direction of the professor N.L. Gerbil'sky's school (Gerbil'sky, 1956), the participation of hypothalamic preoptic-postneurohypophyseal neurosecretory system (PNS) of fish in realization of all stages of breeding, irrespective its season, is established (Garlov, 1971, 2001; Polenov et. al., 1976). With application quantitative histomorphological and cytochemical methods of procedures, including cytospectrophotometry, immunocytochemistry and ultracytochemistry the dynamics in changes of functional activity of all departments of PNS is investigated during spawning at all of different-seasonal-breeding species of Acipenseridae, Salmonidae and Gadidae: the Russian sturgeon (*Acipenser gueldenstaedtii* Brandt), pink (humpback)

salmon (*Oncorhynchus gorbuscha* Walbaum) and burbot (*Lota lota* Linne) (Fig. 1).

Fig 1: Dynamics of changes of functional activity of various departments of PNS in sturgeon, pink salmon and burbot at the process of spawning by data of the quantitative morphometry at levels of light and electron microscopy (after: Garlov, 2001). For comparison the data received in further works and in other species of the Acipenserid fishes are given (B). On a vertical - relative

Brain Opioid Systems in Reproduction Richard G. Dyer, R. John Bicknell, 1989 Many aspects of reproduction including ovulation birth and lactation depend on signals from the brain that control hormone secretion from the pituitary gland This brain endocrine interaction also ensures that the animal's behavior is appropriate for changing reproductive states This volume presents new knowledge on the neural control of reproductive processes from studies of how opioid peptides act within the brain to regulate sexual behavior and reproduction in humans and other mammals The role of brain opioid in the control of gonadotrophin secretion and the onset of puberty the
