Sets And Integration:

Sets and integration An outline of the development D. van Dalen, 2012-12-06 The present text resulted from lectures given by the authors at the Rijks Universiteit at Utrecht These lectures were part of a series on History of Contemporary Mathematics The need for such an enterprise was generally felt since the curriculum at many universities is designed to suit an efficient treatment of advanced subjects rather than to reflect the development of notions and techniques As it is very likely that this trend will continue we decided to offer lectures of a less technical nature to provide students and interested listeners with a survey of the history of topics in our present day mathematics We consider it very useful for a mathematician to have an acquaintance with the history of the development of his subject especially in the nineteenth century where the germs of many of modern disciplines can be found Our attention has therefore been mainly directed to relatively young developments In the lectures we tried to stay clear of both oversimplification and extreme technicality The result is a text that should not cause difficulties to a reader with a working knowledge of mathematics The developments sketched in this book are fundamental for many areas in mathematics and the notions considered are crucial almost everywhere The book may be most useful in particular for those teaching mathematics

A First Course in Spectral Theory Milivoje Lukić, 2022-12-15 The central topic of this book is the spectral theory of bounded and unbounded self adjoint operators on Hilbert spaces After introducing the necessary prerequisites in measure theory and functional analysis the exposition focuses on operator theory and especially the structure of self adjoint operators These can be viewed as infinite dimensional analogues of Hermitian matrices the infinite dimensional setting leads to a richer theory which goes beyond eigenvalues and eigenvectors and studies self adjoint operators in the language of spectral measures and the Borel functional calculus The main approach to spectral theory adopted in the book is to present it as the interplay between three main classes of objects self adjoint operators their spectral measures and Herglotz functions which are complex analytic functions mapping the upper half plane to itself Self adjoint operators include many important classes of recurrence and differential operators the later part of this book is dedicated to two of the most studied classes Jacobi operators and one dimensional Schrödinger operators This text is intended as a course textbook or for independent reading for graduate students and advanced undergraduates Prerequisites are linear algebra a first course in analysis including metric spaces and for parts of the book basic complex analysis Necessary results from measure theory and from the theory of Banach and Hilbert spaces are presented in the first three chapters of the book Each chapter concludes with a number of helpful exercises
