Early Visual Development, Normal and Abnormal Kurt Simons, 1993

Since the 1960s there has been great expansion of our understanding of the development of vision in early life. New techniques and technologies have provided unprecedented insights into the function of all the components of the visual system: optical, motor and neural during this formative period. These insights have come from neurophysiological studies of animal models, electrophysiological and psychophysical studies of infants and young children, and clinical and other studies of such abnormal developmental conditions as amblyopia, lazy eye, nystagmus and prematurity. Despite this broadened scope of study of early visual development, there has never been a comprehensive single text or reference work definitively reviewing the entire field. This important work provides such an overview. Prepared under the auspices of the Committee on Vision of the National Academy of Sciences, National Research Council, its in-depth chapters are written by world authorities. Equally useful to the student or clinician looking for a convenient introduction to the field and to the researcher in seeking explicit detail, this book provides a new degree of integration of this diverse field.

The Poetics of the Mind's Eye Christopher Collins, 1991
