Box,2006-04-21 Masterworks in process improvement and quality technology by George Box and friends George Box has a unique ability to explain complex ideas simply and eloquently This revised edition of his masterworks since 1982 clearly demonstrates the range of his wit and intellect These fascinating readings represent the cornerstones in the theory and application of process improvement product design and process control Readers will gain valuable insights into the fundamentals and philosophy of scientific method using statistics and how it can drive creativity and discovery The book is divided into five key parts Part A Some Thoughts on Quality Improvement concerns the democratization of the scientific method and in such papers as When Murphy Speaks Listen advises managers to view operation of their processes as ongoing opportunities for improvement Part B Design of Experiments for Process Improvement illustrates the enormous advantages offered by experimental design in the pursuit of better products and processes Part C Sequential Investigation and Discovery shows how sequential assembly of designs allows the experimenter to match the difficulty of the problem with the effort needed to solve it Part D Control describes application of feedback control in the Statistical Process Control SPC environment A simple graphical technique using Box Jenkins charts is set forth to appropriately adjust processes to target Part E Variance Reduction and Robustness demonstrates how the existence of more than one source of variation may be used to achieve products robust to the environment in which they must function and emphasizes the importance of error transmission and data transformation in producing robust assemblies A Foreword by Dr J Stuart Hunter allows readers to

gain insight into the workings of a remarkable mind and explains how these ideas can greatly catalyze their efforts in process improvement

**Development of a Safety Evaluation Procedure for Identifying High-risk Signalized Intersections in the Virginia Department of Transportation's Northern Virginia District** Young-Jun Kweon,2007 This research was undertaken to develop an evaluation procedure to identify high risk four legged signalized intersections in VDOT s Northern Virginia district by traffic movements and times of day By using the developed procedure traffic engineers are expected to be able to identify signalized intersections where the traffic crash occurrences under different traffic conditions for different times of day are more frequent than would normally be expected Using generalized linear models such as negative binomial models one safety performance function was estimated for each of nine crash population reference groups formed by three traffic crash patterns crash patterns 1 4 and 6 and four times of day A M peak mid day P M peak and evening off peak Crash pattern 1 is a same direction crash rear end sideswipe or angle crash that occurs after exiting the intersection crash pattern 4 is a right angle crash between two adjacent straight through vehicle movements in the intersection and crash pattern 6 is an angle or head on or opposite sideswipe crash between a straight through vehicle movement and an opposing left turn vehicle movement in the intersection The procedure developed in this study is based on the empirical Bayes EB method Additional data do not need to be collected in order to use the EB procedure because all the data required for applying the EB procedure should be obtainable from VDOT s crash database and from Synchro input data that are already available to traffic engineers for traffic signal phase plans Thus the EB procedure is cost effective and readily applicable For easy application of the EB procedure an EB spreadsheet was developed using Microsoft Excel and a users guide was prepared These are available from the author upon request
