A major advance in the biological sciences in the past decade has been the biochemical identification of cell membrane receptors. The existence of receptor substances on the surface of cells that recognize and bind to extracellular molecules was proposed at the beginning of the century by the pharmacologist and immunologist Paul Ehrlich and the physiologist J N Langley. Since then receptors have been found to play an important role in numerous physiological and pathological processes. Over the years many attempts have been made to physically isolate and chemically characterize receptors but because of the receptors extremely low concentration and membrane localization these efforts have met with limited success. Yet despite the failure to characterize receptor substances the concept of the presence of such molecules has had considerable heuristic value. Using pharmacological, physiological and immunologic approaches researchers have identified several specific receptors e.g. α and adrenergic, nicotinic and muscarinic, cholinergic and histaminergic. With the characterization of various types of receptors on cell membranes many drugs were developed that proved to be experimentally and therapeutically useful. It was only in the early 1970s that methods for the specific measurement, chemical characterization and physical isolation of cell membrane receptors were developed. These advances were made possible by the availability of ligands with high specific radioactivity that retained their biological activity and of experimental procedures that differentiated between specific and non specific binding of ligands.

Neurotransmitters in Embryogenesis Gennadiĭ Alekseevich Buznikov, 1990. Translated from the 1986 Russian edition. Using embryos of various animals mainly marine invertebrates for his research the author argues that contrary to the orthodox view i.e. that neurotransmitters have absolutely no non nervous functions neurotransmitters do in fact exist at pre nerve stages of embryonic development and have possible non transmitter functions such as the triggering and control of first cell divisions involvement in early intercellular interactions and connections with the regulation of morphogenetic movement of cells as well as with the onset and regulation processes of cell differentiation.
