

2 Pharmacokinetic Basis of Therapeutics and Pharmacodynamic Principles

Andrew M. Peterson

The art and science of clinical practice is based on understanding the relationship between the person and the disease and determining the most appropriate means for alleviating symptoms, curing disease, or preventing severe morbidity or even mortality. Very often, medications are prescribed to accomplish one or more of these goals.

Underpinning this treatment process is the intricate relationship between the body and the medication. Often, practitioners seek to understand the effect a drug has on the body (whether therapeutic or harmful) but neglect to consider the effect that the body has on the drug—even though one cannot be understood without the other. How the body acts on a drug and how the drug acts on the body are the subjects of this chapter.

Pharmacokinetics refers to the movement of the drug through the body—in essence, how the body affects the drug. This involves how the drug is administered, absorbed, distributed, and eventually eliminated from the body. *Pharmacodynamics* refers to how the drug affects the body—that is, how the drug initiates its therapeutic or toxic effect, both at the cellular level and systemically. **Box 2.1** lists terms and definitions used throughout this chapter.

BOX 2.1 Definitions of Terms Related to Pharmacokinetics and Pharmacodynamics

Affinity: The attraction between a drug and a receptor.

Allosteric site: A binding site for substrates not active in initiating a response; a substrate that binds to an allosteric site may induce a conformational change in the structure of the active site, rendering it more or less susceptible to response from a substrate.

Bioavailability (F): The fraction or percentage of a drug that reaches the systemic circulation.

Biotransformation: Metabolism or degradation of a drug from an active form to an inactive form.

Chirality: Special configuration or shape of a drug; most drugs exist in two shapes.

Clearance: Removal of a drug from the plasma or organs.

Downregulation: Decreased availability of drug receptors.

Enantiomer (also called isomer): A mirror-image spatial arrangement, or shape, of a drug
