Plant Production And Management Under Drought Conditions:

Plant Production and Management under Drought Conditions J.F. Stone, W.O. Willis, 2012-12-02 For some years workers have been investigating the possibilities of integrating knowledge from soil and atmospheric sciences crop physiology and genetics in order to model crop response to water stress and breed plants for drought resistance This book turns the theory into practice Information gathered from recent symposia and research journals have been built upon by the authors Up to date practices are cited new practices devised and approaches for scientific applications specified The authors have devised numerous examples and applications for their approaches Attention has been given to making these approaches credible in the light of economic and energy limitations Because application of such practice over a wide area requires wide areal sensing and measurement recent advances in remote sensing for these purposes are outlined with methodology for practical application The book will be of interest to a wide readership including crop managers and producers soil scientists agricultural micrometeorologists plant breeders water managers and stress physiologists

Agriculture in Dry Lands I. Arnon, 2012-12-02

Throughout history man has by over use consistently reduced the productive capacity of dry lands This degradation of one third of the land area of the globe is unfortunately increasing In recent years world interest has turned to the problems of pollution of the environment and the impending food shortage as world population grows explosively Thus the attention of international and other agricultural bodies has turned to the need for preserving and developing more effectively the agricultural potential of these areas This book provides a comprehensive review of present knowledge of the agriculture of dry lands with special emphasis on measures for conserving their natural resources Management practices are described which aim at optimizing productivity of rainfed and irrigated agriculture without adverse effects on sustainability Land use in the dry regions and its evolution throughout history is described and analysed and the lessons to be learnt from destructive technologies are stressed In particular current proposals for an alternative agriculture are discussed and their justification is questioned This is a generalist work which specialists can also find interesting not only in their own discipline but as a concise way of acquainting themselves with the state of the art in associated fields Increasing specialisation with each discipline using its own vocabulary leads inevitably to communication problems and the need for multi disciplinary teams makes inter discipline communication indispensable

Water-in-Plants Bibliography J. Pospíšilová, J. Solárová, 2013-06-29

The ninth volume of Water in Plants Bibliography includes papers in all fields of plant water relations research which appeared during the year 1983 from theoretical considerations about the state of water in cell and its membrane transport to drought resistance of plants or physiological significance of irrigation In addition to papers devoted entirely to plant water relations papers on other topics are included if they contain data on plant hydration level water vapour efflux rate of water uptake or water transport etc or if they contain valuable methodological information measurement of selected

microclimatic factors soil moisture etc. We have tried to cover fully the relevant papers which have been published in important scientific periodicals and books. Articles appeared in local journals mimeographed booklets abstracts of thesis and of symposia contributions etc. were chosen mostly from reprints received directly from authors. The courtesy of those is highly appreciated. The manuscript is usually prepared in May and June of the year following the year which it covers.

Unfortunately some reprints come later and thus the respective references appear in the following volume with one year delay. To maximize the value of the bibliography the references are arranged alphabetically according to the authors' names and each volume is provided with three indexes.

Plant Tolerance to Individual and Concurrent Stresses Muthappa Senthil-Kumar, 2017-01-21. This book focuses on multiple plant stresses and the molecular basis of adaptation addressing the molecular mechanism and adaptation for both abiotic and biotic stresses. Ensuring the yield of crop plants grown under multiple individual and/or combined stresses is essential to sustaining productivity. In this regard the development of broad spectrum stress tolerant plants is important. However to date information has largely been compiled only on the individual stress tolerance mechanisms and the mechanisms behind plants' tolerance to two or more individual or simultaneous stresses are not fully understood. Especially combinatorial stress a new stress altogether has only recently been made the object of systematic study. Now several research groups around the world have begun exploring the concurrent stress tolerance mechanisms under both biotic and abiotic stress combinations. This book presents contributions from various experts highlighting the findings of their multiple individual and concurrent stress tolerance dissection studies.

Advances in Soil Science, 2013-03-07. From the beginning of agriculture until about 1950 increased food production came almost entirely from expanding the cropland base. Since 1950 however the yield per unit of land area for major crops has increased dramatically. Much of the increase in yields was because of increased inputs of energy. Between 1950 and 1985 the farm tractor fleet quadrupled world irrigated area tripled and use of fertilizer increased ninefold. Between 1950 and 1985 the total energy used in world agriculture increased 6.9 times. Irrigation played a particularly important role in the rapid increase in food production between 1950 and 1985. The world's irrigated land in 1950 totaled 94 million hectares but increased to 140 million by 1960 to 198 million by 1970 and to 271 million hectares in 1985. However the current rate of expansion has slowed to less than 1 % per year. The world population continues to increase and agricultural production by the year 2000 will have to be 50 to 60% greater than in 1980 to meet demands. This continued demand for food and fiber coupled with the sharp decline in the growth rate of irrigation development means that much of the additional agricultural production in future years must come from cultivated land that is not irrigated. Agricultural production will be expanded in the arid and semiarid regions because these regions make up vast areas in developing countries where populations are rapidly rising.

Plant Breeding M.D. Hayward, N.O. Bosemark, T. Romagosa, 2012-12-06. Our requirement for plant breeders to be successful has never been greater. However one views the forecasted numbers for future population growth we will need in the immediate

future to be feeding clothing and housing many more people than we do inadequately at present Plant breeding represents the most valuable strategy in increasing our productivity in a way that is sustainable and environmentally sensitive Plant breeding can rightly be considered as one of the oldest multidisciplinary subjects that is known to humans It was practised by people who first started to carry out a settled form of agriculture The art as it must have been at that stage was applied without any formal underlying framework but achieved dramatic results as witnessed by the forms of cultivated plants we have today We are now learning how to apply successfully the results of yet imperfect scientific knowledge This knowledge is however rapidly developing particularly in areas of tissue culture biotechnology and molecular biology Plant breeding s inherent multifaceted nature means that alongside obvious subject areas like genetics we also need to consider areas such as statistics physiology plant pathology entomology biochemistry weed science quality seed characteristics repro ductive biology trial design selection and computing It therefore seems apparent that modern plant breeders need to have a grasp of wide range of scientific knowledge and expertise if they are successfully to a exploit the techniques protocols and strategies which are open to them

Biochemical, Physiological and Molecular Avenues for Combating Abiotic Stress in Plants Shabir Hussain Wani, 2018-06-12 Biochemical Physiological and Molecular Avenues for Combating Abiotic Stress in Plants is a must have reference for researchers and professionals in agronomy plant science and horticulture As abiotic stress tolerance is a constant challenge for researchers and professionals working on improving crop production this book combines recent advances with foundational content thus offering in depth coverage on a variety of abiotic stress tolerance mechanisms that help us better understand and improve plant response and

growth under stress conditions The mechanisms explored in this book include stress perception signal transduction and synthesis of stress related proteins and other molecules In addition the book provides a critical understanding of the networks of genes responsible for abiotic stress tolerance and their utilization in the development of stress tolerance in plants Practical breeding techniques and modern genetic analyses are also discussed Unlocks the physiological biochemical and molecular basis of abiotic stress response and tolerance in crop plants Presents comprehensive information on abiotic stress tolerance from gene to whole plant level Includes content on antioxidant metabolism marker assisted selection microarrays next generation sequencing and genome editing techniques *Water-in-plants Bibliography* ,1977
